TUTORIAL

So, you are planning to use the Earth Diagnostics? You don't know how to use them? This is the place to go. From now on this tutorial will guide you through all the process from installation to running.

Hint: If you have any problem with this tutorial, please report it to <javier.vegas@bsc.es> so it can be corrected. A lot of people will benefit from it and you will be mentioned here.

1.1 Installation

For now, you only have an option: download the diagnostics directly from BSC-ES's Gitlab:

```
git clone https://earth.bsc.es/gitlab/es/ocean_diagnostics.git
```

You will also need

- CDO version 1.6.9 (other versions could work, but this is the one we use)
- NCO version 4.5.4 or newer
- Python 2.7 or newer (but no 3.x) with Autosubmit, CDO and NCO packages
- Access to CDFTOOLS_3.0 executables for BSC-ES. At this point, those are located at /home/Earth/jvegas/CDFTOOLS_CMOR/bin.

Call the diags with -h option to see if everything is ready:

```
${PATH_TO_REPOSITORY}/earthdiagnostics.diags.py -h
```

1.2 Creating a config file

If you go into the earthdiagnostics folder in the git repository, you will see a diags.conf that can be used as a model for your config file. It contains commentaries explaining what represents each one of its parameters, so please read it carefully.

Once you have configured your experiment you can execute any diagnostic by calling this command (substitute the variables for the real paths before launching, please)

```
${PATH_TO_REPOSITORY}/earthdiagnostics.diags.py ${PATH_TO_MY_CONF_FILE}
```

And... that's it. You will find your results inside CMOR's folder tree and a folder for the temp files in the scratch. This folder is named after the EXPID.

TIPS AND TRICKS

2.1 Working with ORCA1

If you plan to run diagnostics for ORCA1 resolution, be aware that your workstation will be more than capable to run them. At this resolution, memory and time consumption is low enough to allow you keep using the machine while running, specially if you reserve a pair of cores for other uses.

2.2 Configuring core usage

By default, the Earth Diagnostics creates a thread for each available core for the execution. If you are using a queueing system, the diagnostics will always use the number of cores that you reserved. If you are running outside a queueing system, the diagnostics will try to use all the cores on the machine. To avoid this, add the `MAX_CORES` parameter to the `DIAGNOSTICS` section inside the `diags.conf` file that you are using.

2.3 NEMO files

Unlike the bash version of the ocean diagnostics, this program keeps the NEMO files in the scratch folder so you can launch different configurations for the same experiment with reduced start time. You will need to remove the experiment's folder in the scratch directory at the end of the experiment to avoid wasting resources.

WHAT TO DO IF YOU HAVE AN ERROR

Sometimes, the diagnostics may crash and you will not know why. This section will give you a procedure to follow before reporting the issue. This procedure is intended to solve some common problems or, at least, to help you in creating good issue reports. Remember: a good issue report reduces the time required to solve it!

Hint: Please, read carefully the error message. Most times the error message will point you to the problem's source and sometimes even give you a hint of how to solve it by yourself. And if this is not the case or you find it obscure, even if it was helpful, please contact the developers so it can be improved in further versions

Try this simple steps BEFORE reporting an issue

- Clean scratch folder
- Update to the latest compatible tag: maybe your issue is already solved in it
- If you get the error for the first chunk of a given diagnostic, change the number of chunks to 1
- Call the diags with the `-lc DEBUG -log log.txt` options

Now, you have two options: if everything is fine, the error was probably due to some corrupted files or some unstable machine state. Nevertheless, try running the diagnostic with `-lc DEBUG -log log.txt` for all the chunks. If everything is fine that's all.

If you experienced the same problem again, go to the GitLab portal and look into the open issues (https://earth.bsc.es/gitlab/es/ocean_diagnostics/issues). If you find your issue or a very similar one, use it to report your problems. If you can not find an open one that suits your problem, create a new one and explain what is happening to you.

In any case, it will be very useful if you can attach your `diags.conf` and `log.txt` files.

After that, it's just a matter of waiting for the developers to do their work and answering the questions that they may have. Please, be patient.

DEVELOPER'S GUIDE

The tool provides a set of useful diagnostics, but a lot more can be required at anytime. If you miss something and are able to develop it, you are more than welcome to collaborate. Even if you can not develop it, please let us know what do you want.

The first step is to go to the GitLab page for the project (https://earth.bsc.es/gitlab/es/ocean_diagnostics/) and open a new issue. Be sure that the title is self-explicative and give a detailed description of what you want. Please, be very explicit about what you want to avoid misunderstandings.

Hint: If reading your description, you think that you are taking the developers as stupids, you are doing it perfectly.

Don't forget to add the relevant tags. At this stage you will have to choose between 'enhancement', if you are proposing an improvement on a currently available feature, or 'new feature' in any the other case.

Now, if you are thinking on developing it yourself, please refer to the BSC-ES Git strategy ([wiki_link_when_available](#)) If you have any doubts, or just want help to start the development, contact javier.vegas@bsc.es.

4.1 Developing a diagnostic

For new diagnostics development, we have some advice to give:

- Do not worry about performance at first, just create a version that works. Developers can help you to optimize it later.
- There is nothing wrong with doing some common preparations in the `generate_jobs` of the diagnostic.
- Parallelization is achieved by running multiple diagnostics at a time. You don't need to implement it at diagnostic level
- Use the smallest time frame for your diagnostic: if you can work at chunk level, do not ask for full year data.
- Prefer NCO over CDO, you will have less problems when versions change.
- Ask for help as soon as you get stuck.
- Use always the methods in Utils instead of writing your own code.
- Use meaningful variable names. If you are using short names just to write less, please switch to an editor with autocompletion!
- Do not modify the mesh and mask files, another diagnostic can be using them at the same time.

FREQUENTLY ASKED QUESTIONS

Here will be the answers to the most usual questions. For the moment, there is nothing to see here...

MODULE DOCUMENTATION

6.1 earthdiagnostics

6.1.1 earthdiagnostics.box

class earthdiagnostics.box.**Box** (*depth_in_meters=False*)

Bases: `object`

Represents a box in the 3D space. Also allows easy conversion from the coordinate values to significant string representations

depth_in_meters = None

If True, treats the depth as if it is given in meters. If False, as it is given in levels :rtype: bool

get_depth_str()

Gets a string representation of depth. For depth expressed in meters, it adds th character ‘m’ to the end
If min_depth is different from max_depth, it concatenates the two values :return: string representation for depth :rtype: str

get_lat_str()

Gets a string representation of the latitude in the format XX{N/S}. If min_lat is different from max_lat, it concatenates the two values :return: string representation for latitude :rtype: str

get_lon_str()

Gets a string representation of the longitude in the format XX{E/W}. If min_lon is different from max_lon, it concatenates the two values :return: string representation for longitude :rtype: str

max_depth = None

Maximum depth :rtype: float

max_lat

Maximum latitude :rtype: float

max_lon

Maximum longitude :rtype: float

min_depth = None

Minimum depth :rtype: float

min_lat

Minimum latitude :rtype: float

min_lon

Minimum longitude :rtype: float

6.1.2 earthdiagnostics.constants

Contains the enumeration-like classes used by the diagnostics

class `earthdiagnostics.constants.Basin` (*shortname, fullname, box=None*)

Bases: `object`

Class representing a given basin

Parameters

- **shortname** (*str*) – sfull basin's name
- **fullname** (*str*) – full basin's name
- **box** (`Box`) – box defining the basin

box = None

Box representing the basin

fullname

Basin's full name :rtype: str

shortname

Basin's short name :rtype: str

class `earthdiagnostics.constants.Basins`

Bases: `object`

Predefined basins

Antarctic = `<earthdiagnostics.constants.Basin object>`

Antarctic Ocean

AntarcticAtlantic = `<earthdiagnostics.constants.Basin object>`

Antarctic Ocean Atlantic Sector

AntarcticIndian = `<earthdiagnostics.constants.Basin object>`

Antarctic Ocean Indian Sector

Weddell_Sea

Western_Central_Arctic = <earthdiagnostics.constants.Basin object>
Western_Central_Arctic

classmethod parse (*basin*)

Return the basin matching the given name. If the parameter *basin* is a *Basin* instance, directly returns the same instance. This behaviour is intended to facilitate the development of methods that can either accept a name or a *Basin* instance to characterize the basin.

Parameters **basin** (*str* | *Basin*) – basin name or basin instance

Returns basin instance corresponding to the basin name

Return type *Basin*

class earthdiagnostics.constants.**Models**

Bases: *object*

Predefined models

ECEARTH_2_3_O1L42 = 'Ec2.3_O1L42'
EC-Earth 2.3 ORCA1 L42

ECEARTH_3_0_O1L46 = 'Ec3.0_O1L46'
EC-Earth 3 ORCA1 L46

ECEARTH_3_0_O25L46 = 'Ec3.0_O25L46'
EC-Earth 3 ORCA0.25 L46

ECEARTH_3_0_O25L75 = 'Ec3.0_O25L75'
EC-Earth 3 ORCA0.25 L75

ECEARTH_3_1_O25L75 = 'Ec3.1_O25L75'

EC-Earth 3.1 ORCA0.25 L75

GLORYS2_V1_O25L75 = 'glorys2v1_O25L75'

GLORYS2v1 ORCA0.25 L75

NEMOVAR_O1L42 = 'nemovar_O1L42'

NEMOVAR ORCA1 L42

NEMO_3_2_O1L42 = 'N3.2_O1L42'

NEMO 3.2 ORCA1 L42

NEMO_3_3_O1L46 = 'N3.3_O1L46'

NEMO 3.3 ORCA1 L46

NEMO_3_6_O1L46 = 'N3.6_O1L46'

NEMO 3.6 ORCA1 L75

6.1.3 earthdiagnostics.cdftools

class earthdiagnostics.cdftools.**CDFTools** (*path*='')

Bases: `object`

Class to run CDFTools executables

Parameters *path* (*str*) – path to CDFTOOLS binaries

run (*command*, *input*, *output*=None, *options*=None, *log_level*=20)

Runs one of the CDFTools

Parameters

- **command** (*str*) – executable to run
- **input** (*str*) – input file
- **output** – output file. Not all tools support this parameter
- **options** (*str* / *list*) – options for the tool.
- **log_level** (*int*) – log level at which the output of the cdftool command will be added

6.1.4 earthdiagnostics.datamanager

class earthdiagnostics.datamanager.**DataManager** (*exp_manager*, *institution*, *model*, *expid*,
datafolder, *frequency*, *experiment_name*,
scratch_dir, *nfrp*, *calendar*='standard')

Bases: `object`

Class to manage the data repositories

Parameters

- **exp_manager** (`ExperimentManager`) –
- **institution** (*str*) – CMOR's institution name
- **model** (*str*) – CMOR's model name
- **expid** (*str*) – experiment identifier
- **datafolder** (*str*) – Folder containing the data

- **frequency** (*str*) – default frequency
- **experiment_name** (*str*) – CMOR’s experiment name
- **scratch_dir** (*str*) – path to scratch folder
- **nfrp** (*int*) – sample frequency
- **calendar** (*str*) – experiment’s calendar

static domain_abbreviation (*domain, frequency*)

Returns the table name for a domain-frequency pair :param domain: variable’s domain :type domain: str
:param frequency: variable’s frequency :type frequency: str :return: variable’s table name :rtype: str

extract_variable (*file_path, handler, frequency, member, startdate, temp, variable*)

Extracts a variable from a file and creates the CMOR file

Parameters

- **file_path** (*str*) – path to the file
- **handler** (*netCDF\$.Dataset*) – netCDF4 handler for the file
- **frequency** (*str*) – variable’s frequency
- **member** (*int*) – member
- **startdate** (*str*) – startdate
- **temp** (*str*) – temporal file to use
- **variable** (*str*) – variable’s name

get_file (*domain, var, startdate, member, chunk, grid=None, box=None, frequency=None*)

Copies a given file from the CMOR repository to the scratch folder and returns the path to the scratch’s copy

Parameters

- **domain** (*str*) – CMOR domain
- **var** (*str*) – variable name
- **startdate** (*str*) – file’s startdate
- **member** (*int*) – file’s member
- **chunk** (*int*) – file’s chunk
- **grid** (*str*) – file’s grid (only needed if it is not the original)
- **box** (*Box*) – file’s box (only needed to retrieve sections or averages)
- **frequency** (*str*) – file’s frequency (only needed if it is different from the default)

Returns path to the copy created on the scratch folder

Return type *str*

get_startdate_path (*startdate*)

Returns the path to the startdate’s CMOR folder :param startdate: target startdate :type startdate: str :return: path to the startdate’s CMOR folder :rtype: str

get_year (*domain, var, startdate, member, year, grid=None, box=None*)

Gets all the data corresponding to a given year from the CMOR repository to the scratch folder as one file and returns the path to the scratch’s copy.

Parameters

- **year** (*int*) – year to retrieve
- **domain** (*str*) – CMOR domain
- **var** (*str*) – variable name
- **startdate** (*str*) – file's startdate
- **member** (*int*) – file's member
- **grid** (*str*) – file's grid (only needed if it is not the original)
- **box** (*Box*) – file's box (only needed to retrieve sections or averages)

Returns path to the copy created on the scratch folder

Return type *str*

prepare_CMOR_files (*force_rebuild, ocean, atmosphere*)

Prepares the data to be used by the diagnostic.

If CMOR data is not created, it show a warning and closes. In the future, an automatic cmorization procedure will be launched

If CMOR data is available but packed, the procedure will unpack it.

Parameters

- **atmosphere** (*bool*) – activates atmosphere files cmorization
- **ocean** (*bool*) – activates ocean files cmorization
- **force_rebuild** (*bool*) – if True, forces the creation of the CMOR files

Returns

send_file (*filetosend, domain, var, startdate, member, chunk=None, grid=None, region=None, box=None, rename_var=None, frequency=None, year=None, date_str=None*)

Copies a given file to the CMOR repository. It also automatically converts to netCDF 4 if needed and can merge with already existing ones as needed

Parameters

- **date_str** –
- **year** (*int*) – if frequency is yearly, this parameter is used to give the corresponding year
- **rename_var** (*str*) – if exists, the given variable will be renamed to the one given by var
- **filetosend** (*str*) – path to the file to send to the CMOR repository
- **region** (*str*) – specifies the region represented by the file. If it is defined, the data will be appended to the CMOR repository as a new region in the file or will overwrite if region was already present
- **domain** (*str*) – CMOR domain
- **var** (*str*) – variable name
- **startdate** (*str*) – file's startdate
- **member** (*int*) – file's member
- **chunk** (*int*) – file's chunk
- **grid** (*str*) – file's grid (only needed if it is not the original)
- **box** (*Box*) – file's box (only needed to retrieve sections or averages)

- **frequency** (*str*) – file’s frequency (only needed if it is different from the default)

Returns path to the copy created on the scratch folder

Return type *str*

class `earthdiagnostics.datamanager.UnitConversion` (*source, destiny, factor, offset*)

Bases: `object`

Class to manage unit conversions

classmethod `add_conversion` (*conversion*)

Adds a conversion to the dictionary

Parameters `conversion` (`UnitConversion`) – conversion to add

classmethod `get_conversion_factor_offset` (*input_units, output_units*)

Gets the conversion factor and offset for two units . The conversion has to be done in the following way:
converted = original * factor + offset

Parameters

- **input_units** (*str*) – original units
- **output_units** (*str*) – destiny units

Returns factor and offset

Return type [float, float]

classmethod `load_conversions` ()

Load conversions from the configuration file

class `earthdiagnostics.datamanager.Variable` (*line*)

Bases: `object`

Class to characterize a CMOR variable. It also contains the static method to make the match between thje original name and the standard name. Requires `cmor_table.csv` to work.

classmethod `get_variable` (*original_name*)

Returns the cmor variable instance given a variable name

Parameters `original_name` (*str*) – original variable’s name

Returns CMOR variable

Return type *Variable*

classmethod `load_variables` ()

Loads the `cmor_table.csv` and creates the variables dictionary

6.1.5 earthdiagnostics.diagnostic

class `earthdiagnostics.diagnostic.Diagnostic` (*data_manager*)

Bases: `object`

Base class for the diagnostics. Provides a common interface for them and also has a mechanism that allows diagnostic retrieval by name.

Parameters `data_manager` (`DataManager`) – data manager that will be used to store and retrieve the necessary data

alias = None

Alias to call the diagnostic. Must be overridden at the derived classes

compute()

Calculates the diagnostic and stores the output

Must be implemented by derived classes

classmethod generate_jobs (*diags, options*)

Generate the instances of the diagnostics that will be run by the manager

Must be implemented by derived classes.

Parameters

- **diags** (*Diags*) – diagnostics manager
- **options** (*list[str]*) – list of strings containing the options passed to the diagnostic

Returns

static get_diagnostic (*name*)

Return the class for a diagnostic given its name

Parameters **name** (*str*) – diagnostic alias

Returns the selected Diagnostic class, None if name can not be found

Return type *Diagnostic*

static register ()

Register a new diagnostic using the given alias. It must be call using the derived class. :param cls: diagnostic class to register :type cls: Diagnostic

6.1.6 earthdiagnostics.diags

class earthdiagnostics.diags.**Diags** (*config_file*)

Bases: *object*

Launcher class for the diagnostics

Parameters **config_file** (*str*) – path to the configuration file

run ()

Run the diagnostics

earthdiagnostics.diags.**main** ()

Entry point for the Earth Diagnostics. For more detailed documentation, use -h option

6.1.7 earthdiagnostics.experimentmanager

class earthdiagnostics.experimentmanager.**ExperimentManager** (*startdates, members, num_chunks, chunk_size, member_digits, calendar='standard'*)

Bases: *object*

Encapsulates all chunk related tasks

Parameters

- **startdates** (*list[str]*) – startdates to run
- **members** (*list[int]*) – members to run
- **num_chunks** (*int*) – chunks to run

- **chunk_size** (*int*) – length of the chunks in months
- **member_digits** (*int*) – minimum number of digits to use in the member name
- **calendar** (*str*) – experiment’s calendar

get_chunk_list ()

Return a list with all the chunks :return: List containing tuples of startdate, member and chunk :rtype: tuple[str, int, int]

get_full_years (*startdate*)

Returns the list of full years that are in the given startdate :param startdate: startdate to use :type startdate: str :return: list of full years :rtype: list[int]

get_member_list ()

Return a list with all the members :return: List containing tuples of startdate and member :rtype: tuple[str, int, int]

get_member_str (*member*)

Returns the member name for a given member number. :param member: member’s number :type member: int :return: member’s name :rtype: str

get_year_chunks (*startdate*, *year*)

Get the list of chunks containing timesteps from the given year :param startdate: startdate to use :type startdate: str :param year: reference year :type year: int :return: list of chunks containing data from the given year :rtype: list[int]

6.1.8 earthdiagnostics.utils

class earthdiagnostics.utils.TempFile

Bases: *object*

Class to manage temporal files

autoclean = **True**

If True, new temporary files are added to the list for future cleaning

static clean ()

Removes all temporary files created with Tempfile until now

files = []

List of files to clean automatically

static get (*filename=None*, *clean=None*, *suffix='.nc'*)

Gets a new temporal filename, storing it for automated cleaning

Parameters

- **suffix** –
- **filename** (*str*) – if it is not none, the function will use this filename instead of a random one
- **clean** (*bool*) – if true, stores filename for cleaning

Returns path to the temporal file

Return type *str*

prefix = 'temp'

Prefix for temporary filenames

scratch_folder = ‘

Scratch folder to create temporary files on it

class earthdiagnostics.utils.**Utils**

Bases: `object`

Container class for miscellaneous utility methods

static available_cpu_count ()

Number of available virtual or physical CPUs on this systemx

cdo = <cdo.Cdo object>

An instance of Cdo class ready to be used

static concat_variables (source, destiny, remove_source=False)

Add variables from a nc file to another :param source: path to source file :type source: str :param destiny: path to destiny file :type destiny: str :param remove_source: if True, removes source file :type remove_source: bool

static convert2netcdf4 (filetoconvert, force=True)

Checks if a file is in netCDF4 format and converts to netCDF4 if not

Parameters

- **force** (*bool*) – if true, converts the file regardless of original encoding. Useful to make sure that a file has deflation and shuffle activated
- **filetoconvert** (*str*) – file to convert

static copy_variable (source, destiny, variable, must_exist=True, add_dimensions=False)

Copies the given variable from source to destiny

Parameters

- **add_dimensions** (*bool*) – if it's true, dimensions required by the variable will be automatically added to the file. It will also add the dimension variable
- **source** (*netCDF4.Dataset*) – origin file
- **destiny** (*netCDF4.Dataset*) – destiny file
- **variable** (*str*) – variable to copy
- **must_exist** (*bool*) – if false, does not raise an error if variable does not exist

Returns

static execute_shell_command (command, log_level=10)

Executes a shell command :param command: command to execute

Log.info('Detailed time for diagnostic class') :param log_level: log level to use for command output :type log_level: int :return: command output :rtype: list

static expand_path (path)

Expands character ~ and system variables on the given path :param path: path to expand :type path: str :return: path after the expansion

static get_datetime_from_netcdf (handler, time_variable='time')

Gets a datetime array from a netCDF file

Parameters

- **handler** (*netCDF4.Dataset*) – file to read
- **time_variable** (*str*) – variable to read, by default 'time'

Returns Datetime numpy array created from the values stored at the netCDF file

Return type np.array

static get_file_hash (*filepath*)

Returns the MD5 hash for the given filepath :param filepath: path to the file to compute hash on :type filepath:str :return: file's MD5 hash :rtype: str

static get_mask (*basin*)

Returns a numpy array containing the mask for the given basin

Parameters **basin** (*Basin*) – basin to retrieve

Returns mask

Return type numpy.array

static move_file (*source, destiny*)

Moves a file from source to destiny, creating dirs if necessary

Parameters

- **source** (*str*) – path to source
- **destiny** (*str*) – path to destiny

nco = <nco.nco.Nco object>

An instance of Nco class ready to be used

static openCdf (*filepath, mode='a'*)

Opens a netCDF file and returns a handler to it

Parameters

- **filepath** (*str*) – path to the file
- **mode** (*str*) – mode to open the file. By default, a (append)

Returns handler to the file

Return type netCDF4.Dataset

static rename_variable (*filepath, old_name, new_name, must_exist=True, rename_dimension=False*)

Rename multiple variables from a NetCDF file :param filepath: path to file :type filepath: str :param old_name: variable's name to change :type old_name: str :param new_name: new name :type new_name: str :param must_exist: if True, the function will raise an exception if the variable name does not exist :type must_exist: bool :param rename_dimension: if True, also rename dimensions with the same name :type rename_dimension: bool

static rename_variables (*filepath, dic_names, must_exist=True, rename_dimension=False*)

Rename multiple variables from a NetCDF file :param filepath: path to file :type filepath: str :param dic_names: dictionary containing old names as keys and new names as values :type dic_names: dict :param must_exist: if True, the function will raise an exception if the variable name does not exist :type must_exist: bool :param rename_dimension: if True, also rename dimensions with the same name :type rename_dimension: bool

static setminmax (*filename, variable_list*)

Sets the valid_max and valid_min values to the current max and min values on the file :param filename: path to file :type filename: str :param variable_list: list of variables in which valid_min and valid_max will be set :type variable_list: str | list

6.2 earthdiagnostics.ocean

6.2.1 earthdiagnostics.ocean.areamoc

class earthdiagnostics.ocean.areamoc.**AreaMoc** (*data_manager, startdate, member, chunk,*
basin, box)

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Compute an Atlantic MOC index by averaging the meridional overturning in a latitude band between 1km and 2km or any other index averaging the meridional overturning in a given basin and a given domain

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created March 2012

Last modified June 2016

Parameters

- **data_manager** (*DataManager*) – data management object
- **startdate** (*str*) – startdate
- **member** (*int*) – member number
- **chunk** (*int*) – chunk’s number
- **basin** (*Basin*) – basin to compute
- **box** (*Box*) – box to compute

alias = ‘mocarea’

Diagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – minimum latitude, maximum latitude, minimum depth, maximum depth, basin=Global

Returns

6.2.2 earthdiagnostics.ocean.averagesection

class earthdiagnostics.ocean.averagesection.**AverageSection** (*data_manager, startdate,*
member, chunk, variable,
domain, box)

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Compute an average of a given zone. The variable MUST be in a regular grid

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created March 2012

Last modified June 2016

Parameters

- **data_manager** (`DataManager`) – data management object
- **startdate** (`str`) – startdate
- **member** (`int`) – member number
- **chunk** (`int`) – chunk’s number
- **variable** (`str`) – variable’s name
- **domain** (`str`) – variable’s domain
- **box** (`Box`) – box to use for the average

alias = ‘avgsection’

Dagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (`Diags`) – Diagnostics manager class
- **options** (`list[str]`) – variable, minimum longitude, maximum longitude, minimum latitude, maximum latitude, domain=ocean

Returns

6.2.3 earthdiagnostics.ocean.convectionsites

class earthdiagnostics.ocean.convectionsites.**ConvectionSites** (*data_manager, start-date, member, chunk, model_version*)

Bases: `earthdiagnostics.diagnostic.Diagnostic`

Compute the intensity of convection in the four main convection sites

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created October 2013

Last modified June 2016

Parameters

- **data_manager** (`DataManager`) – data management object
- **startdate** (`str`) – startdate
- **member** (`int`) – member number
- **chunk** (`int`) – chunk’s number
- **model_version** (`str`) – model version

alias = 'convection'

Dagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – None

Returns

6.2.4 earthdiagnostics.ocean.cutsection

class earthdiagnostics.ocean.cutsection.**CutSection** (*data_manager, startdate, member, chunk, variable, domain, zonal, value*)

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Cuts a meridional or zonal section

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created September 2012

Last modified June 2016

Parameters

- **data_manager** (*DataManager*) – data management object
- **startdate** (*str*) – startdate
- **member** (*int*) – member number
- **chunk** (*int*) – chunk's number
- **variable** (*str*) – variable's name
- **domain** (*str*) – variable's domain
- **zonal** (*bool*) – specifies if section is zonal or meridional
- **value** (*int*) – value of the section's coordinate

alias = 'cutsection'

Dagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – variable, zonal, value, domain=ocean

Returns**6.2.5 earthdiagnostics.ocean.gyres**

class earthdiagnostics.ocean.gyres.**Gyres** (*data_manager*, *startdate*, *member*, *chunk*,
model_version)

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Compute the intensity of the subtropical and subpolar gyres

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created October 2013

Last modified June 2016

Parameters

- **data_manager** (*DataManager*) – data management object
- **startdate** (*str*) – startdate
- **member** (*int*) – member number
- **chunk** (*int*) – chunk’s number
- **model_version** (*str*) – model version

alias = ‘gyres’

Diagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags*, *options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – None

Returns**6.2.6 earthdiagnostics.ocean.interpolate**

class earthdiagnostics.ocean.interpolate.**Interpolate** (*data_manager*, *startdate*, *mem-*
ber, *chunk*, *variable*, *domain*,
model_version)

Bases: *earthdiagnostics.diagnostic.Diagnostic*

3-dimensional conservative interpolation to the regular atmospheric grid. It can also be used for 2D (i,j) variables

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created November 2012

Last modified June 2016

Parameters

- **data_manager** (`DataManager`) – data management object
- **startdate** (`str`) – startdate
- **member** (`int`) – member number
- **chunk** (`int`) – chunk’s number
- **variable** (`str`) – variable’s name
- **domain** (`str`) – variable’s domain
- **model_version** (`str`) – model version

alias = ‘interp’

Diagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (`Diags`) – Diagnostics manager class
- **options** (`list[str]`) – variable, domain=ocean

Returns

6.2.7 earthdiagnostics.ocean.maxmoc

class earthdiagnostics.ocean.maxmoc.**MaxMoc** (*data_manager, startdate, member, year, basin, box*)

Bases: `earthdiagnostics.diagnostic.Diagnostic`

Compute an Atlantic MOC index by finding the maximum of the annual mean meridional overturning in a latitude / depth region

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created March 2012

Last modified June 2016

Parameters

- **data_manager** (`DataManager`) – data management object
- **startdate** (`str`) – startdate
- **member** (`int`) – member number
- **year** (`int`) – year to compute
- **basin** (`Basin`) – basin to compute
- **box** (`Box`) – box to compute

alias = ‘mocmax’

Diagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each complete year to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – minimum latitude, maximum latitude, minimum depth, maximum depth, basin=global

Returns

6.2.8 earthdiagnostics.ocean.mixedlayersaltcontent

```
class earthdiagnostics.ocean.mixedlayersaltcontent.MixedLayerSaltContent (data_manager,
                                                                    start-
                                                                    date,
                                                                    mem-
                                                                    ber,
                                                                    chunk)
```

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Compute mixed layer salt content

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created February 2012

Last modified June 2016

Parameters

- **data_manager** (*DataManager*) – data management object
- **startdate** (*str*) – startdate
- **member** (*int*) – member number
- **chunk** (*int*) – chunk's number

alias = 'mlotstsc'

Diagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – None

Returns

6.2.9 earthdiagnostics.ocean.moc

```
class earthdiagnostics.ocean.moc.Moc (data_manager, startdate, member, chunk)
```

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Compute the MOC for oceanic basins

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created March 2012

Last modified June 2016

Parameters

- **data_manager** (*DataManager*) – data management object
- **startdate** (*str*) – startdate
- **member** (*int*) – member number
- **chunk** (*int*) – chunk’s number

alias = ‘moc’

Dagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – None

Returns

6.2.10 earthdiagnostics.ocean.psi

class earthdiagnostics.ocean.psi.**Psi** (*data_manager, startdate, member, chunk*)

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Compute the barotropic stream function

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created March 2012

Last modified June 2016

Parameters

- **data_manager** (*DataManager*) – data management object
- **startdate** (*str*) – startdate
- **member** (*int*) – member number
- **chunk** (*int*) – chunk’s number

alias = ‘psi’

Dagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)
Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – None

Returns

6.2.11 earthdiagnostics.ocean.siasiesiv

class earthdiagnostics.ocean.siasiesiv.**Siasiesiv** (*data_manager, basin, startdate, member, chunk, mask*)

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Compute the sea ice extent, area and volume in both hemispheres or a specified region.

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Neven Fuckar <neven.fuckar@bsc.es>

Contributor Ruben Cruz <ruben.cruzgarcia@bsc.es>

Contributor Javier Vegas-Regidor <javier.vegas@bsc.es>

Created April 2012

Last modified June 2016

alias = 'siasiesiv'

Diagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)
Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – basin

Returns

6.2.12 earthdiagnostics.ocean.verticalmean

class earthdiagnostics.ocean.verticalmean.**VerticalMean** (*data_manager, startdate, member, chunk, variable, box*)

Bases: *earthdiagnostics.diagnostic.Diagnostic*

Chooses vertical level in ocean, or vertically averages between 2 or more ocean levels

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Eleftheria Exarchou <eleftheria.exarchou@bsc.es>

Contributor Javier Vegas-Regidor <javier.vegas@bsc.es>

Created February 2012

Last modified June 2016

Parameters

- **data_manager** (`DataManager`) – data management object
- **startdate** (`str`) – startdate
- **member** (`int`) – member number
- **chunk** (`int`) – chunk’s number
- **variable** (`str`) – variable to average
- **box** (`Box`) – box used to restrict the vertical mean

alias = ‘vertmean’

Diagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (`Diags`) – Diagnostics manager class
- **options** (`list[str]`) – variable, minimum depth (level), maximum depth (level)

Returns

6.2.13 earthdiagnostics.ocean.verticalmeanmeters

```
class earthdiagnostics.ocean.verticalmeanmeters.VerticalMeanMeters (data_manager,  
startdate,  
member,  
chunk, variable,  
box)
```

Bases: `earthdiagnostics.diagnostic.Diagnostic`

Averages vertically any given variable

Original author Virginie Guemas <virginie.guemas@bsc.es>

Contributor Javier Vegas-Regidor<javier.vegas@bsc.es>

Created February 2012

Last modified June 2016

Parameters

- **data_manager** (`DataManager`) – data management object
- **startdate** (`str`) – startdate
- **member** (`int`) – member number
- **chunk** (`int`) – chunk’s number
- **variable** (`str`) – variable to average
- **box** (`Box`) – box used to restrict the vertical mean

alias = ‘vertmeanmeters’

Diagnostic alias for the configuration file

compute ()

Runs the diagnostic

classmethod generate_jobs (*diags, options*)

Creates a job for each chunk to compute the diagnostic

Parameters

- **diags** (*Diags*) – Diagnostics manager class
- **options** (*list[str]*) – variable, minimum depth (meters), maximum depth (meters)

Returns
