

EUROGEOSS WORKSHOP 2019

#EGW2019

3-5 JULY 2019, LISBON

Panagiotis Kosmopoulos

InDust Cost Action – Impacts on Solar Energy

inDust

The inDust Cost action

International Network to Encourage the Use of Monitoring and Forecasting Dust Products

Organic Carbon + Elemental carbon

Dust

Sulfate

Sea salt

Our goal

dust user-oriented
services

The inDust Cost action

Who

Researchers on:

- Satellite products
- Ground observations
- Dust forecasting models
- Climate
- Socio-economic impacts

Users:

- Solar energy
- Aviation
- Air Quality
- Health
- International bodies (WMO, UNCCD, ...)

The problem: Dust effect on solar radiation

- Attenuation of solar radiation reaching the PVs or CSP mirrors
- Horizontal attenuation (mirrors to central point)

PV

CSP

The problem: Dust effect on solar radiation

- Soiling → panels efficiency and water management

Dust effect on PV and CSP input

$AOD = 0.034 - 0.966$

GHI attenuation = 0.7 – 12.9 %

DNI attenuation = 2.9 – 41.0 %

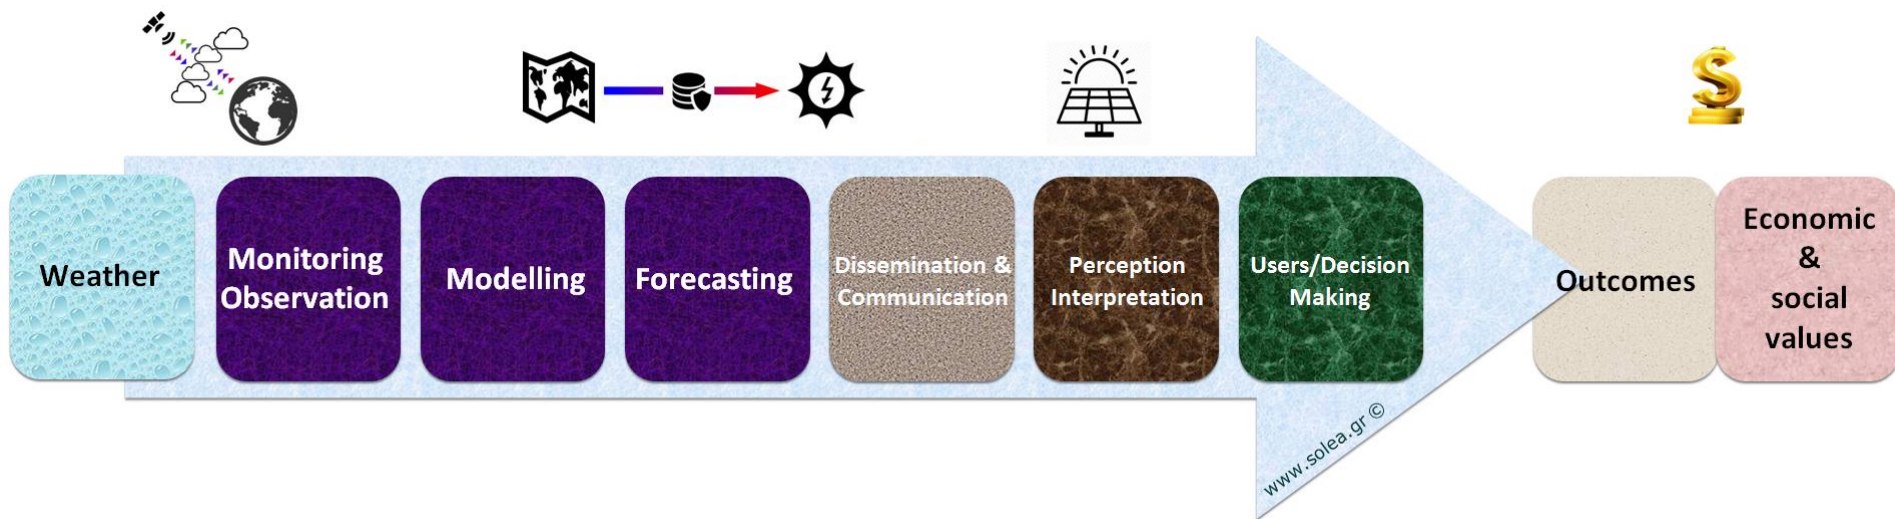

Monthly averages of solar energy percentage attenuation relative to the aerosol-free simulations under MODIS-based AODs.

Outstanding

- The InDust COST Action website has been launched
- RGB dust product from Himawari-8 and GOES-16
- Training Workshop on Sand and Dust Storms in the Arab Region
- The 9th International Workshop on Sand / Dust storm and Associated Dustfall. Call for Abstracts
- InDust

Subscribe to the Public Newsletter!

To be informed about our activities, news and events related to dust. Frequency is almost monthly.

Addressing the problem

Calculate attenuation / optimum and existing infrastructures ... Inclination

CAMS

Geo-Cradle SENSE

MSG

Translate solar radiation parameters to solar energy and economic effects

End user involvement: the Aswan heart hospital

CORNERS	NORTH	EAST
1	9.24° 08' 32.50"	32° 48' 22.84"
2	9.24° 08' 32.25"	32° 48' 08.50"
3	9.24° 08' 30.00"	32° 48' 26.50"
4	9.24° 08' 28.25"	32° 48' 38.50"

Area = 1260000 m2 (300 Feddan)

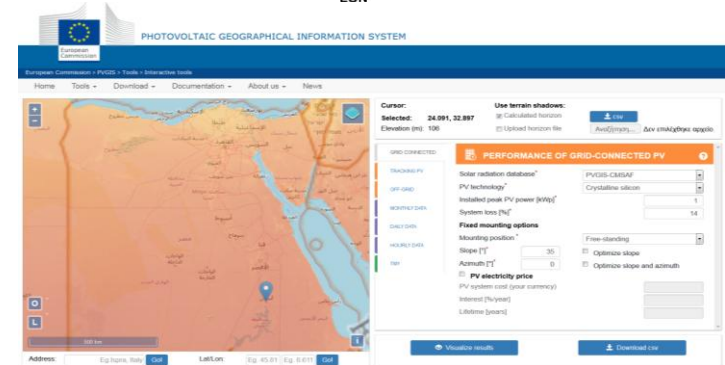

EUMETSAT CM-SAF

Development of business plan for establishment, operation and exploitation of a solar farm in Aswan (Egypt).

GEOSS funded project

PVGIS

Economic management plans

Photovoltaic (PV) installations

Concentrated Solar Power (CSP) plants

Simulated scenario: 10 MW (produces annually almost 25,687 kWh or 976,000 USD)

Economic management plans

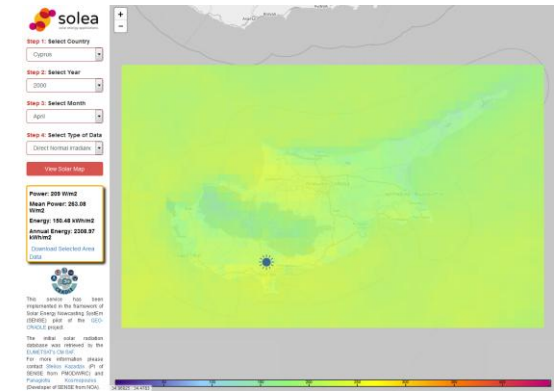

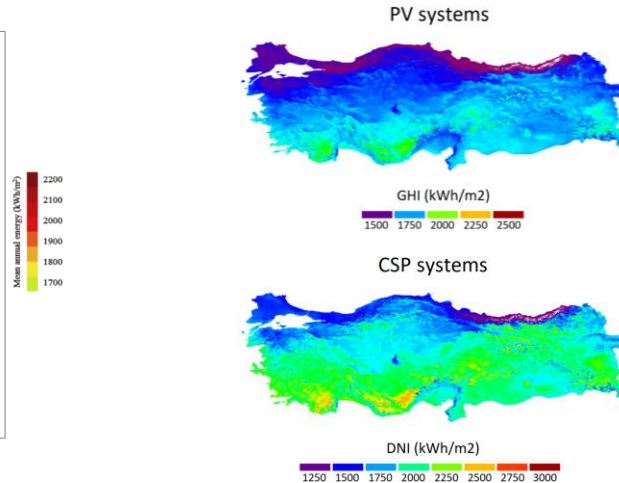

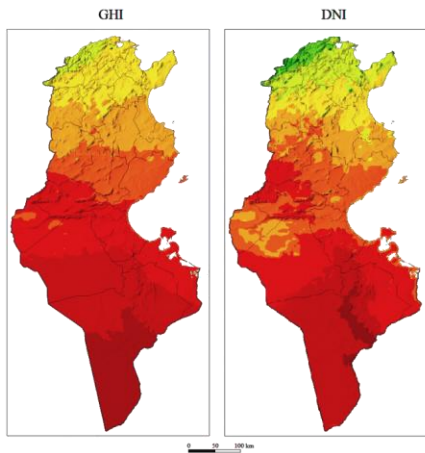

EP = Energy production
 DR = Daily revenue
 FL = Financial losses

The blue insets show the solar power (and FL in red), using as input the MODIS observations.

Upscaling opportunities

Such energy data and techniques can be used at any area covered by EO. For that purpose 8 national bodies (institutes, TSOs, DSOs, ministries) from Egypt (MERE, CEDARE), Turkey (TUBITAK UZAY), Greece (PPCR, IPTO), Cyprus (CUT), Morocco (CRTS) and Tunisia (CERT) have declared their interest in the participation of the further development and use of the described dust and solar energy solutions.

Towards this direction, the inDust will contribute to the scientific and energy market knowledge by providing an holistic approach on desert dust and solar energy management and planning.

Contribution to EuroGEOSS vision

- Response to solar energy demand in high solar potential areas where dust plays the most important role as attenuator
- Use of CAMS, EO
- Direct user uptake and use
- Possibilities for using this platform for other areas in N. Africa
- InDust searches to build a community of researches and users that can start designing the strategy to develop dust services

Thanks for your attention!
