

Drivers of the natural CO₂ fluxes at global scale as simulated by CMIP6 piControl simulations

Yohan Ruprich-Robert (BSC)

4C Annual Meeting, May 2021, virtual

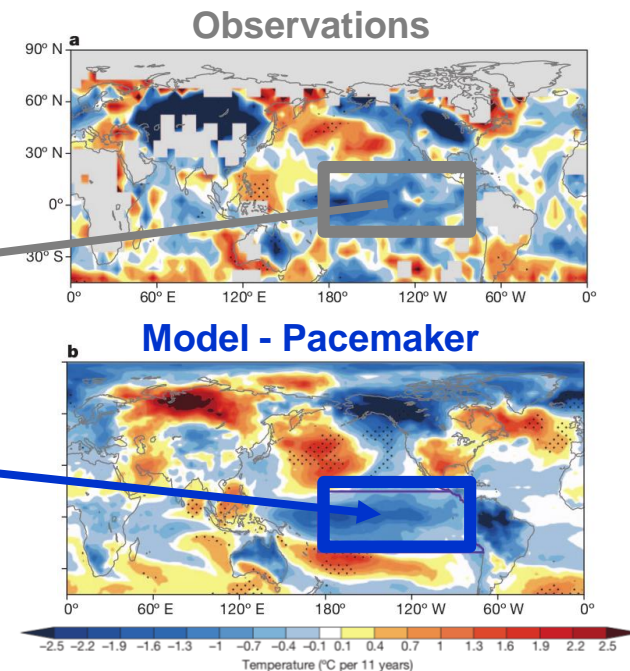

Main processes and drivers of internal atmospheric CO₂ variability?

Task 2.1.2 – Potential predictability: processes, drivers and key regions

- Hot spot regions driving global CO₂ variability
- Pacemaker experiments

Ensemble members simulations in which a sub-region of the ocean surface is restored to the chronology of the observed variability.

- Global variability driven by this region
- upper bound of predictability skill if this region is fully predicted

(from Kosaka and Xie 2013)

Main processes and drivers of internal atmospheric CO2 variability?

Task 2.1.2 – Potential predictability: processes, drivers and key regions

- Hot spot regions driving global CO2 variability
- Pacemaker experiments

Ensemble members simulations in which a sub-region of the ocean surface is restored to the chronology of the observed variability.

- Global variability driven by this region
- upper bound of predictability skill if this region is fully predicted

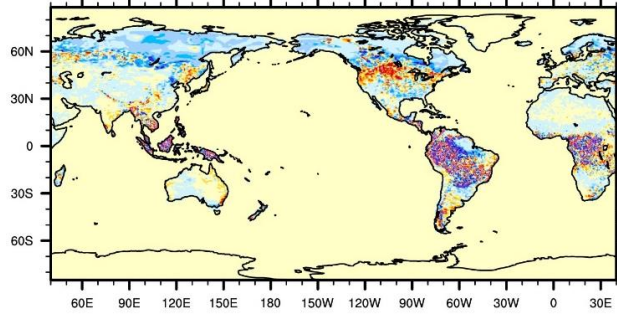

What are the hot spot regions for the global atmospheric CO2 variability?

- Explore surface CO2 fluxes in piControl of CMIP6
- EC-Earth3-CC, IPSL-CM6A-LR, MPI-ESM1-2-LR

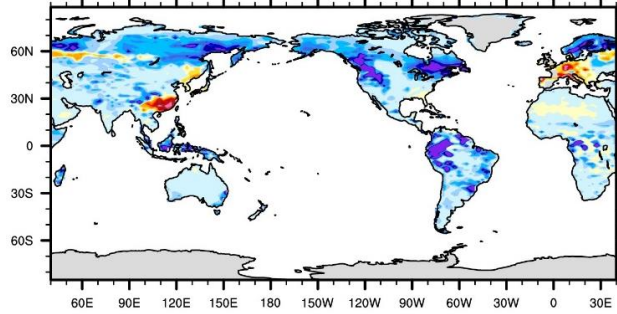

Model mean states

Climatology land CO2 fluxes (positive into land)

EC-Earth3-CC_piControl

IPSL-CM6A-LR_piControl

MPI-ESM1-2-LR_piControl

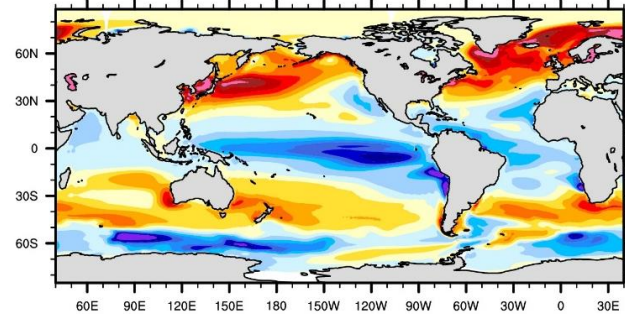

Climatology ocean CO2 fluxes (positive into ocean)

EC-Earth3-CC_piControl

IPSL-CM6A-LR_piControl

MPI-ESM1-2-LR_piControl

Model mean states

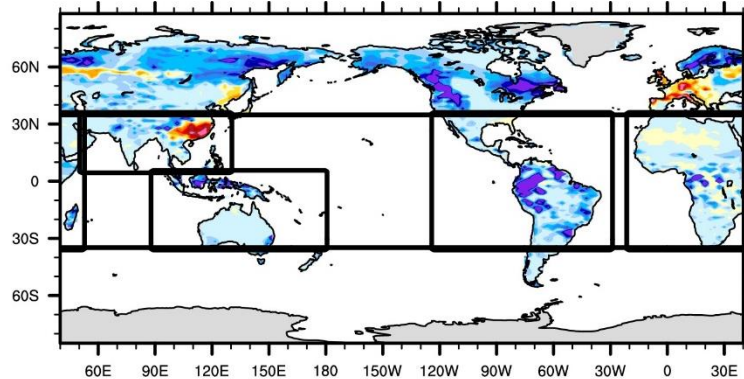

Climatology land CO2 fluxes

(positive into land)

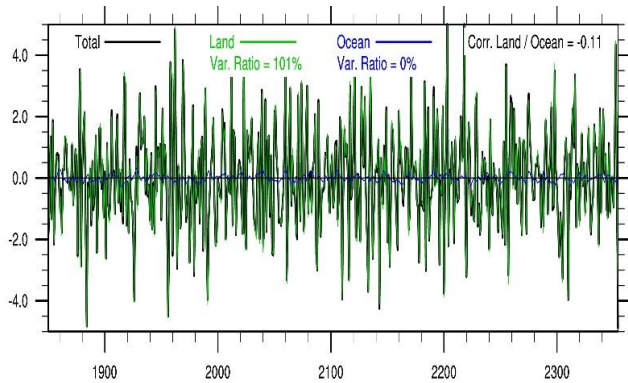

Climatology ocean CO2 fluxes

(positive into ocean)

Globally integrated surface CO2 fluxes

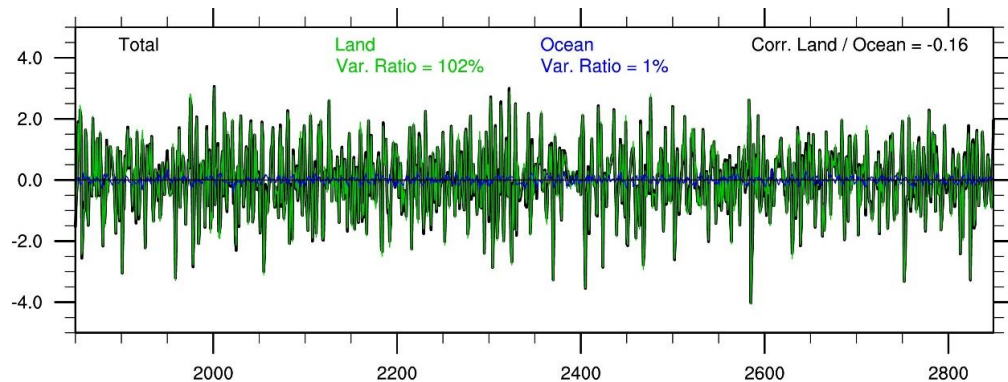

Anomalous Global surface Carbon Mass Flux to the atmosphere (PgC/yr)
(land + ocean)

EC-Earth3-CC

IPSL-CM6A-LR

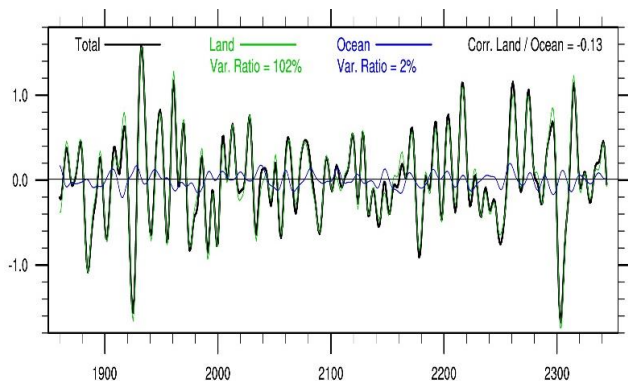

MPI-ESM1-2-LR

Warning: not same simulation length!!

Globally integrated surface CO2 fluxes – 10yr low pass filtered

Anomalous Global surface Carbon Mass Flux to the atmosphere (PgC/yr)
(land + ocean)

10yr low pass filtered

EC-Earth3-CC

IPSL-CM6A-LR

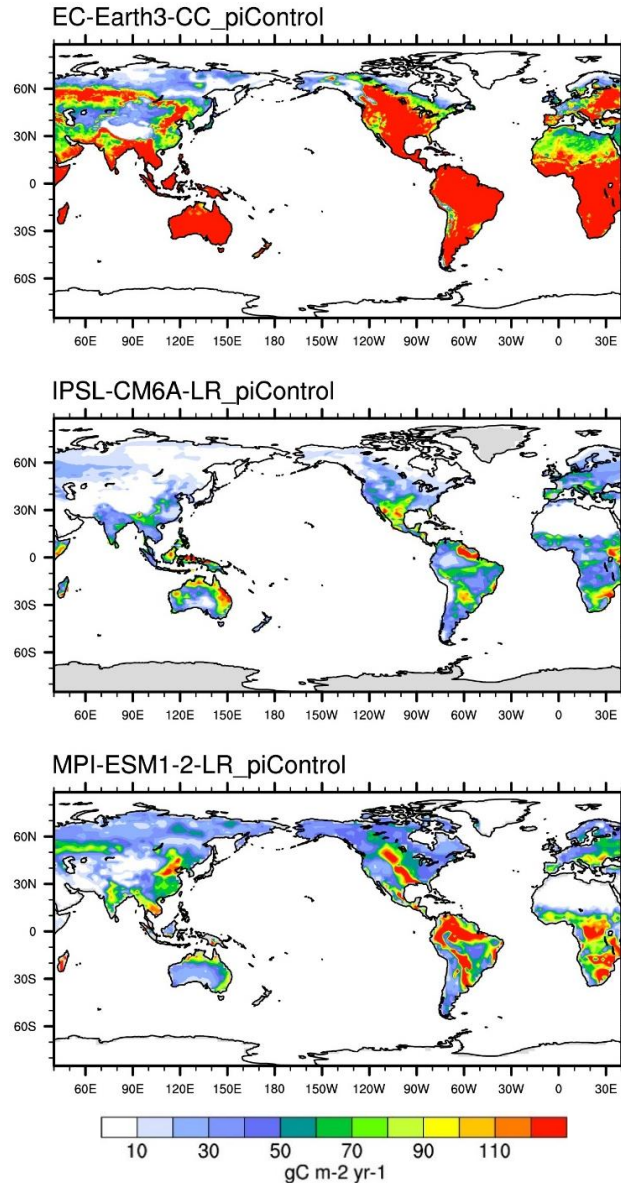

MPI-ESM1-2-LR

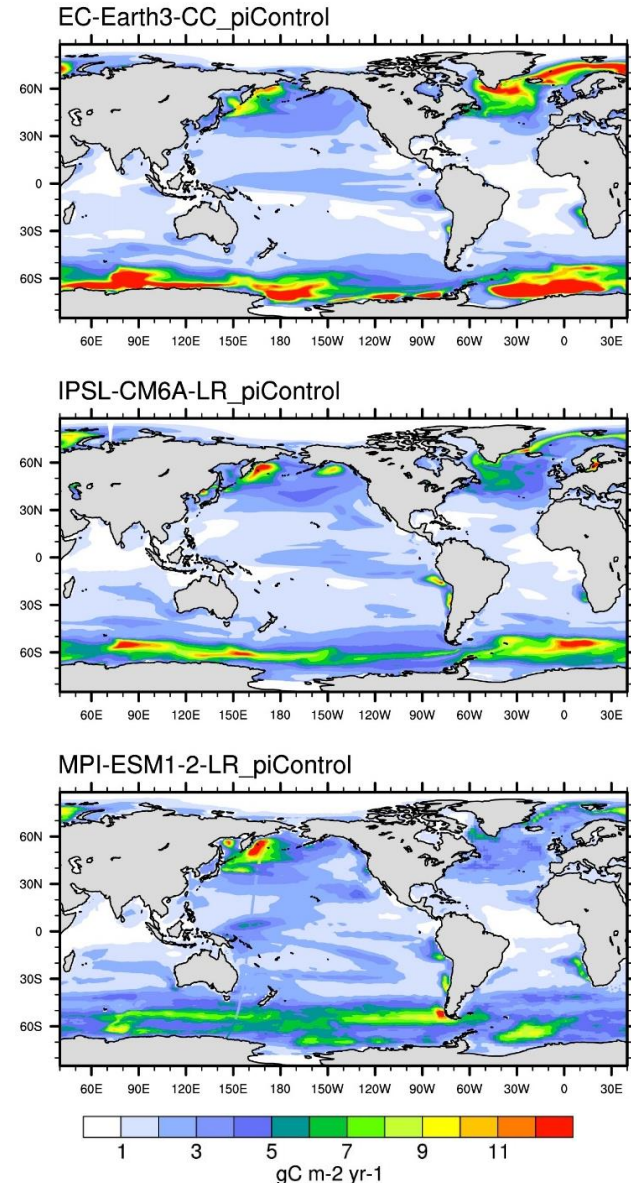

Warning: not same simulation length!!

Which regions control the global variations?

Standard deviation land CO2 fluxes

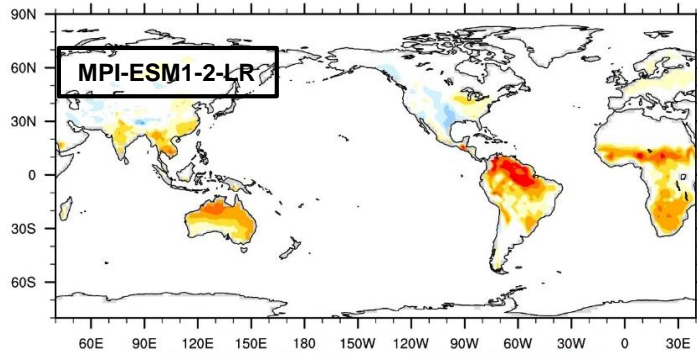

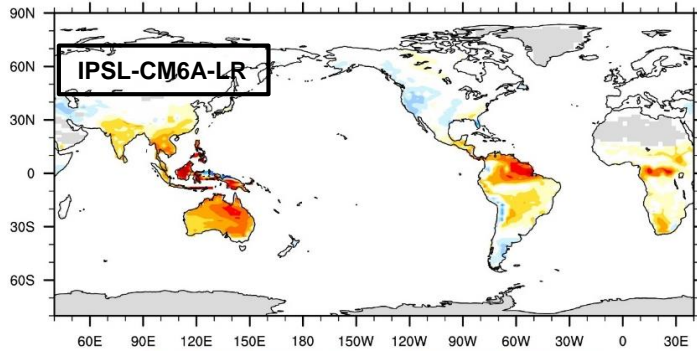

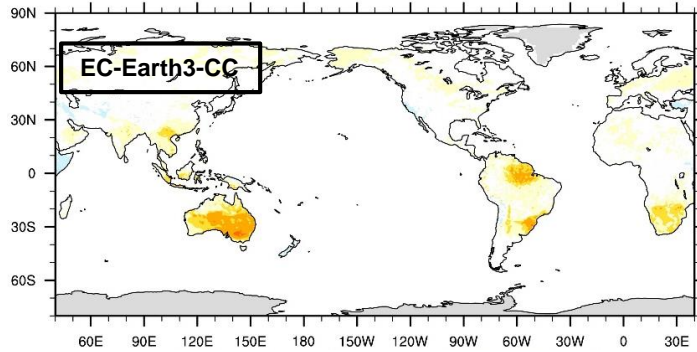

Standard deviation ocean CO2 fluxes

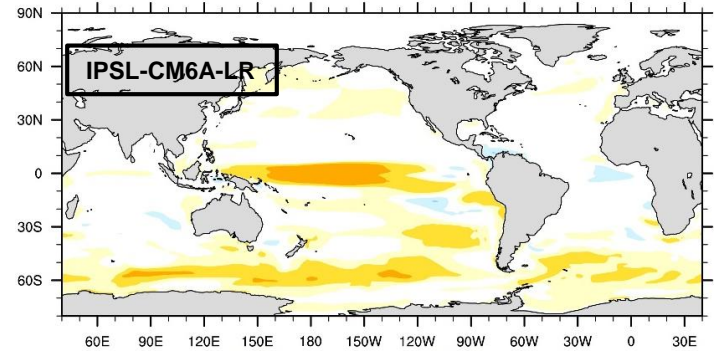

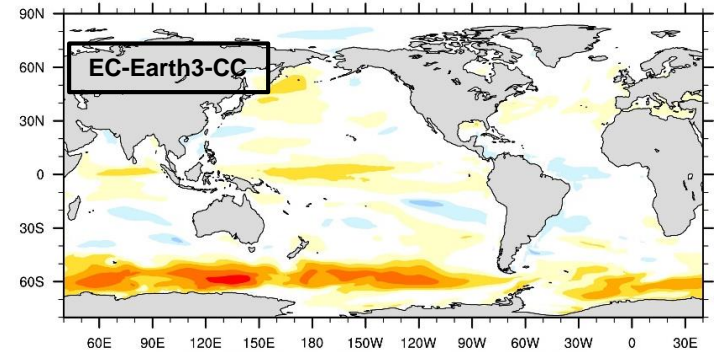

Which regions control the global variations?

Local correlation of CO₂ fluxes on Globally averaged CO₂ fluxes

Land fluxes vs Global land fluxes

Ocean fluxes vs Global ocean fluxes

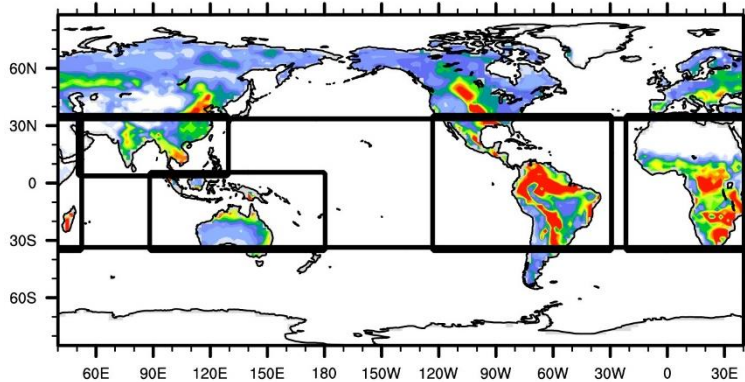

Which regions control the global variations?

Standard deviation land CO2 fluxes

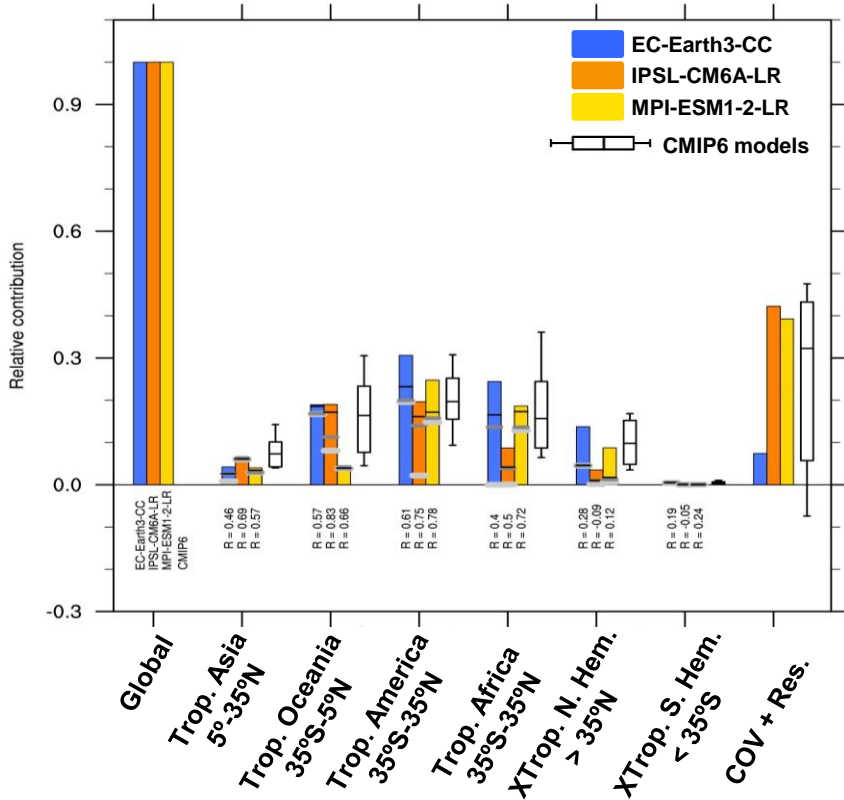

Standard deviation ocean CO2 fluxes

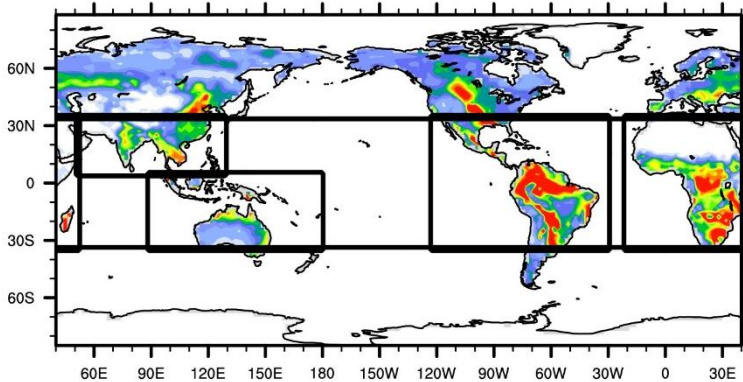

Which regions control the global variations?

Regional contribution to global land CO2 fluxes

Regional contribution to global ocean CO2 fluxes

What are the drivers of those variations?

EC-Earth3-CC

IPSL-CM6A-LR

MPI-ESM1-2-LR

Oceania

Tropical America

Africa

X-Trop.
N. Hemi.

Correlation map of local surface temperature with global land CO2 fluxes

What are the drivers of those variations?

Correlation map of local surface temperature with global ocean CO₂ fluxes

EC-Earth3-CC

IPSL-CM6A-LR

MPI-ESM1-2-LR

Tropical Pacific

Southern Ocean

Summary

Analyse of CMIP6 piControl simulations show that:

- 1) Land CO2 fluxes variability 10x higher than ocean CO2 fluxes variability
 - implication for prediction of atmospheric CO2 variability

- 2) Regions contributing the most to global variations are:
 - Australia
 - South America
 - sub-Saharan Africa
 - all linked to tropical SST variations (ENSO?)

- 3) Over the ocean the regions contributing the most are
 - Southern Ocean
 - tropical Pacific
 - Different SST signature among models

Conclusion: Tropical Pacific appears as the main driver of global CO2 variability

In WP2 we will first perform tropical Pacific pacemaker experiments

Summary
