SUNSET: the SUbseasoNal to decadal climate forecast post-processiNg and asSEssmenT suite

SUNSET is a software suite developed collaboratively at the Barcelona Supercomputing Center, that aims post-process climate forecast outputs to provide climate services for sub-seasonal, seasonal and decadal time scales.

Its **modular design** allows the technicians and researchers flexibility in defining the required products, post-processing steps, outputs and visualization options. These computations can then be easily parallelized on HPC platforms, making use of the Autosubmit workflow manager.
