# Introduction : the aim

# Which tool ? EC-Earth

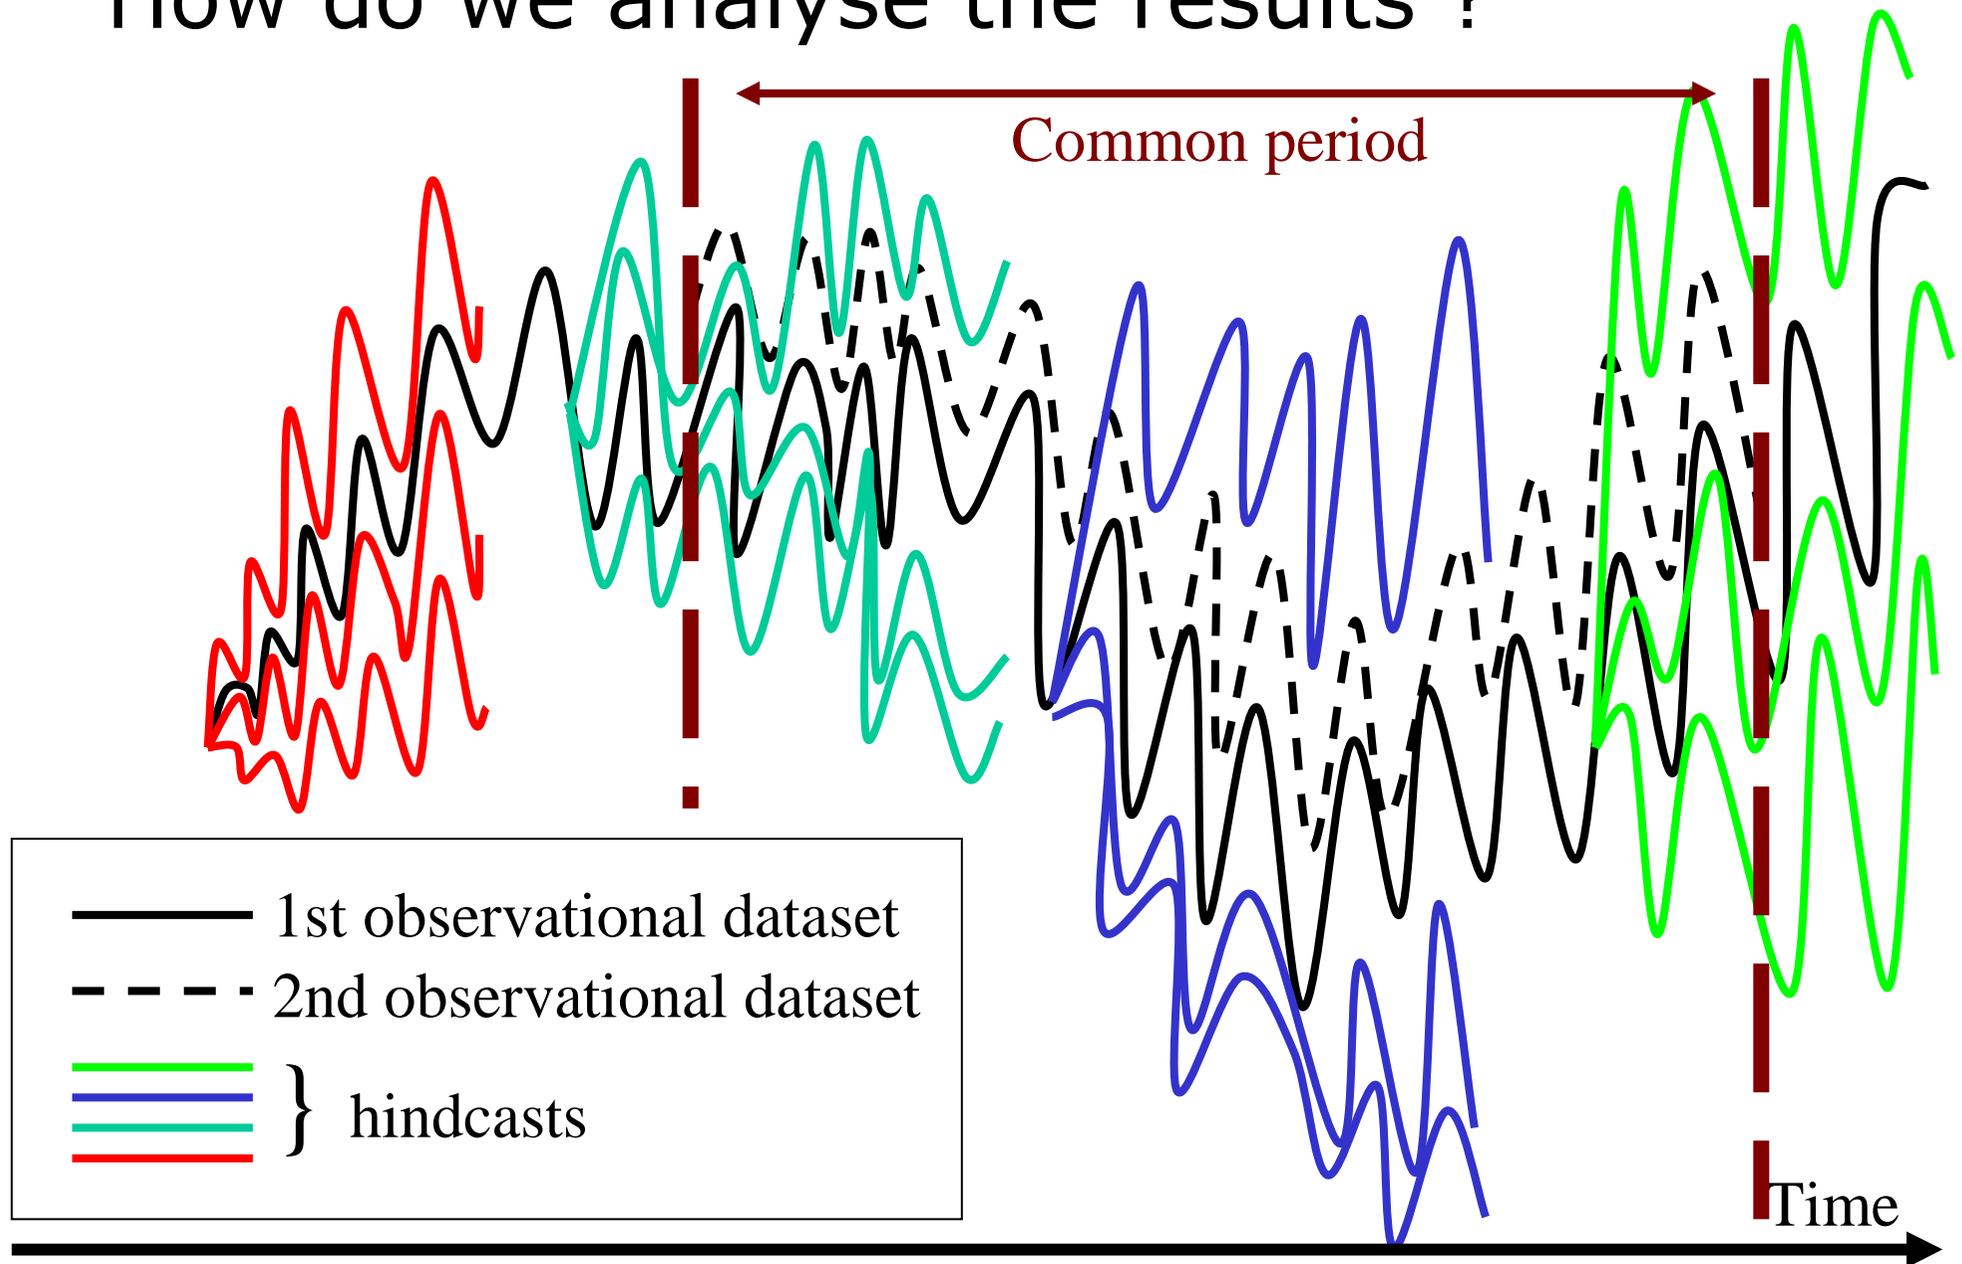

EC-Earth is an Earth System Model (ESM) with three major components: the atmosphere model IFS (ECMWF), the ocean model NEMO and coupler OASIS3.

# Which experimental design ?

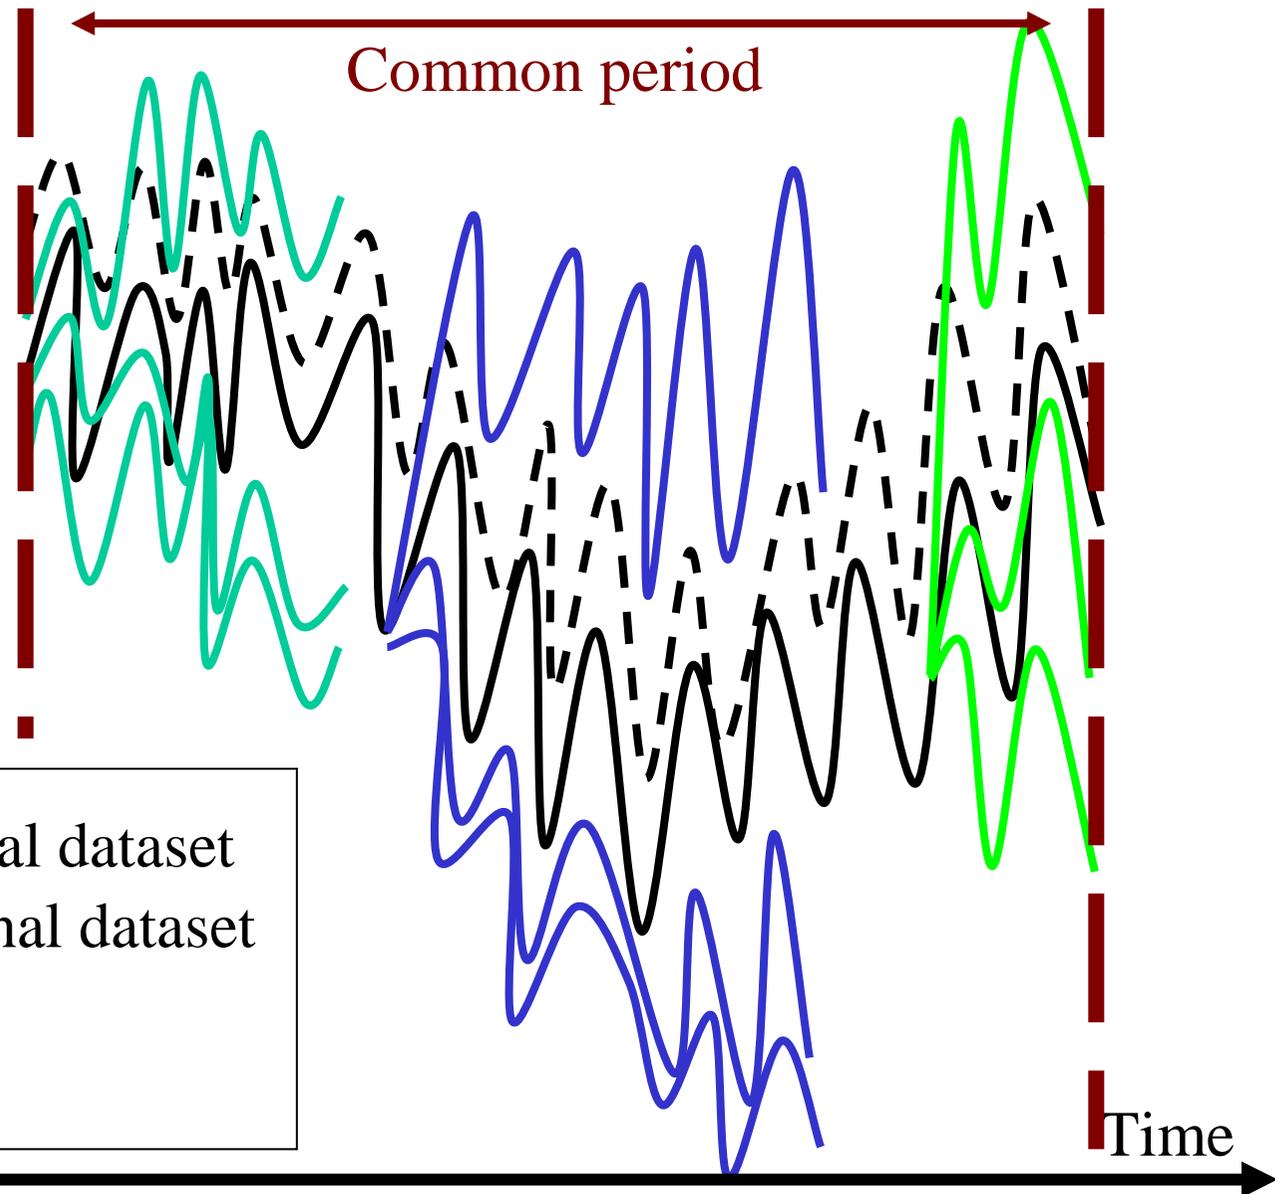

- Atmosphere and soil initial conditions: ERA40/ERAINT (five members, ECMWF)
- Ocean initial conditions: NEMOVAR (COMBINE, five members, ECMWF)
- Sea ice initial conditions: A single run of LIM2 forced with DFS4.3 (KNMI, SMHI)
- Three experiments are performed:
  - Atmospheric perturbation only
  - Ocean perturbation only
  - Both Atmospheric and ocean perturbation
- Simulations starting November 1 of 1960, 1965, 1970, 1975, 1980, 1985, 1990, 1995, 2000 and 2005 with 60-month long run for each starting date.

# How do we analyse the results ?

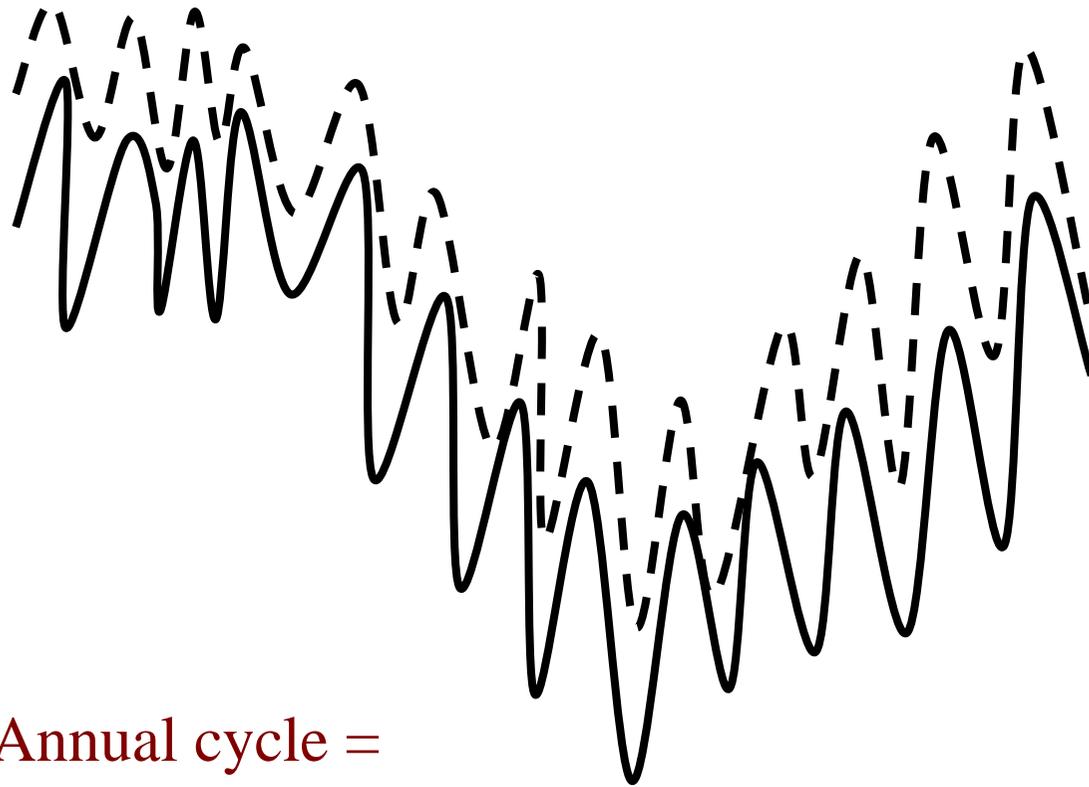

— 1st observational dataset  
 - - - 2nd observational dataset  
 } hindcasts  
 (red, cyan, blue, green lines)

# How do we analyse the results ?

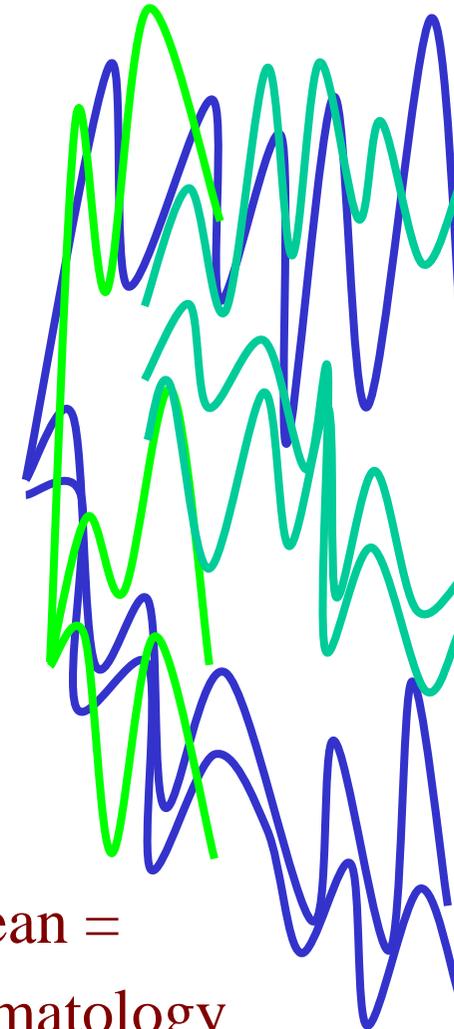

— 1st observational dataset  
 - - - 2nd observational dataset  
 } hindcasts  
 (Cyan, Blue, Green lines)

# How do we analyse the results ?

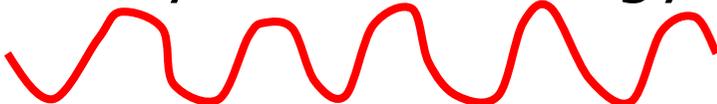

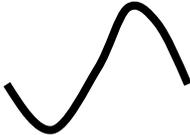

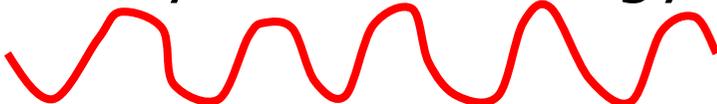

Annual cycle =  
climatology  
of the observations/reanalyses

Mean =  
climatology  
of the hindcasts

# How do we analyse the results ?

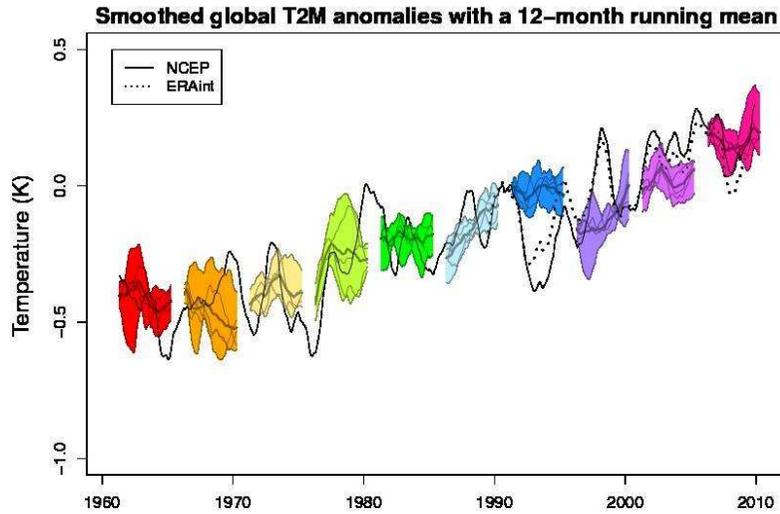

Observations/reanalyses climatology  and hindcasts  climatology  are removed from the raw time-series over the whole period, not only the common one for :

- 1) Two-meter temperature
- 2) Sea surface temperature
- 3) Sea ice area (Arctic/Antarctic)
- 4) Global ocean heat content (0-315m, 373-657m, 800m-bottom)
- 5) Atlantic Meridional Overturning Circulation maximum and latitude of this maximum

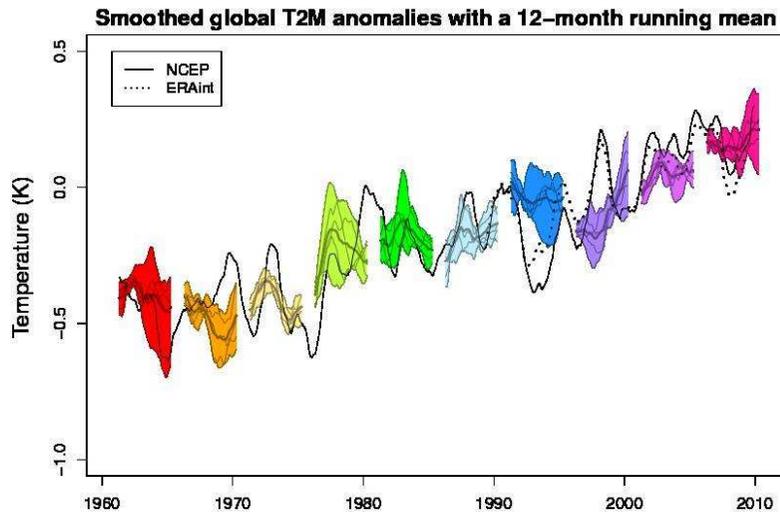

# Two-metre air temperature

Global-mean temperature for EC-Earth v2.2 (pre-SO4 fix).  
Anomalies smoothed out with 12-month running mean.

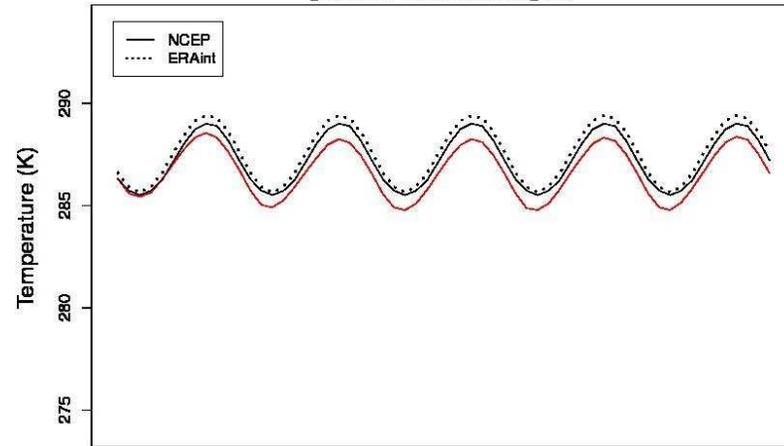

Atmosphere and ocean perturbations

Atmosphere only perturbations

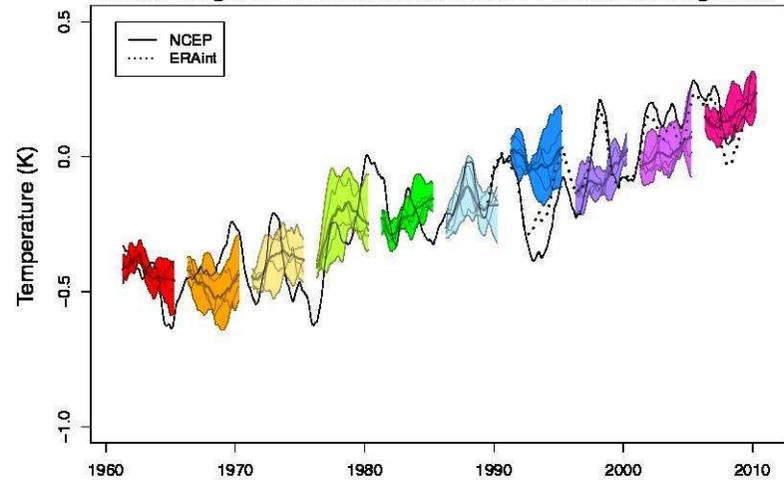

global T2M climatologies

Pair Climatology  
Atm-Oc perturb

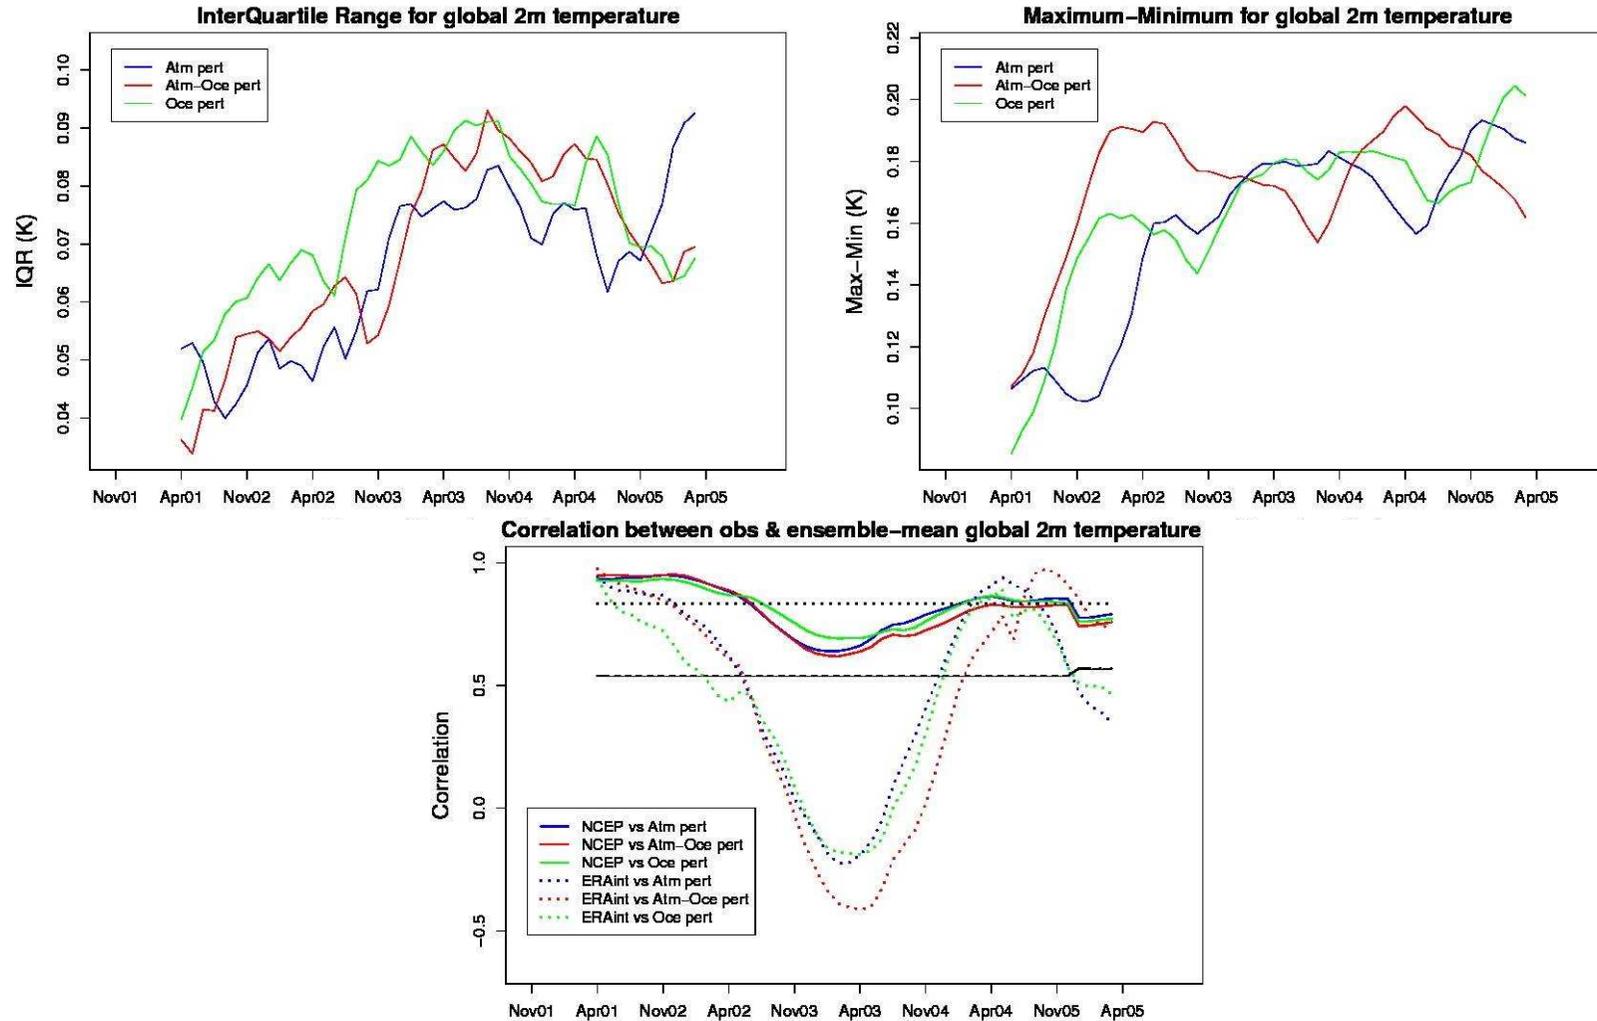

Smoothed global T2M anomalies with a 12-month running mean

Ocean only perturbations

# Two-metre air temperature

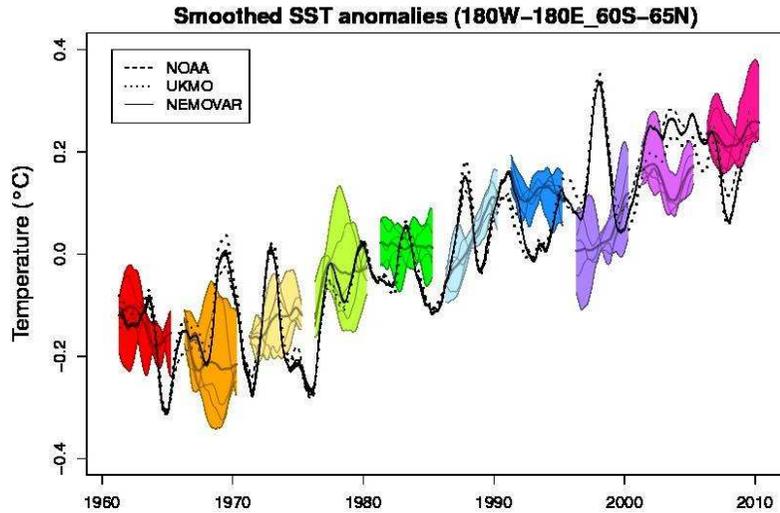

Average over the 10 starting dates of the interquartile range/ Maxi-mini/correlations of smoothed anomalies with reanalyses

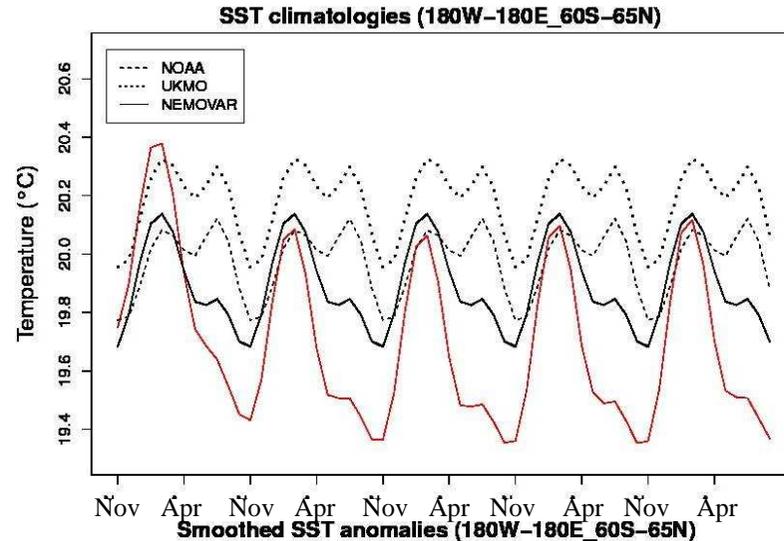

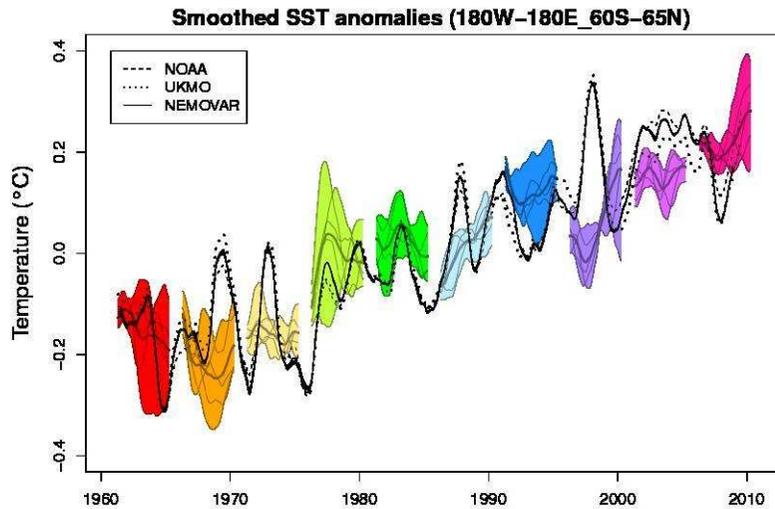

# Sea Surface Temperatures

60°S-65°N global temperature for EC-Earth v2.2 (pre-SO4 fix). Anomalies smoothed out with 12-month running mean.

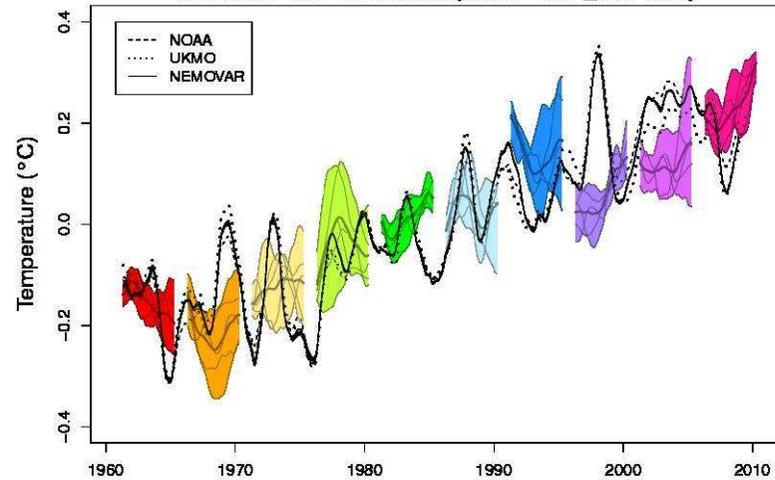

Atmosphere and ocean perturbations

Atmosphere only perturbations

Pair Climatology Atm-Oc perturb

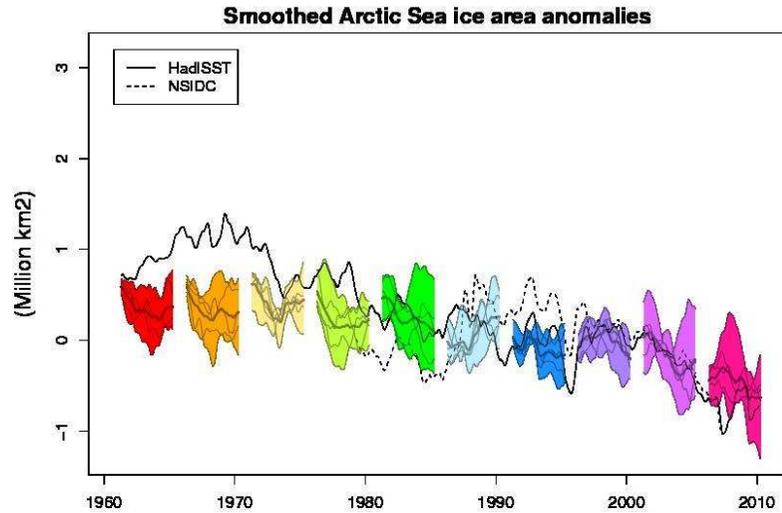

Ocean only perturbations

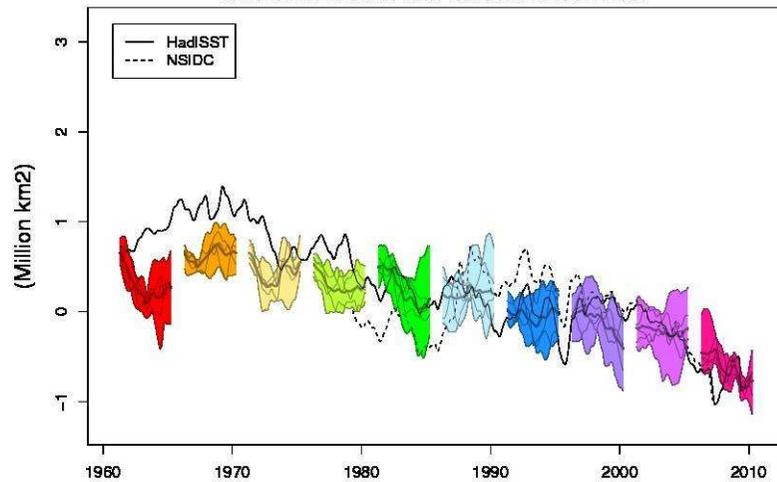

# Arctic Sea ice area

Arctic sea ice area for EC-Earth v2.2 (pre-SO4 fix).  
Anomalies smoothed out with 12-month running mean.

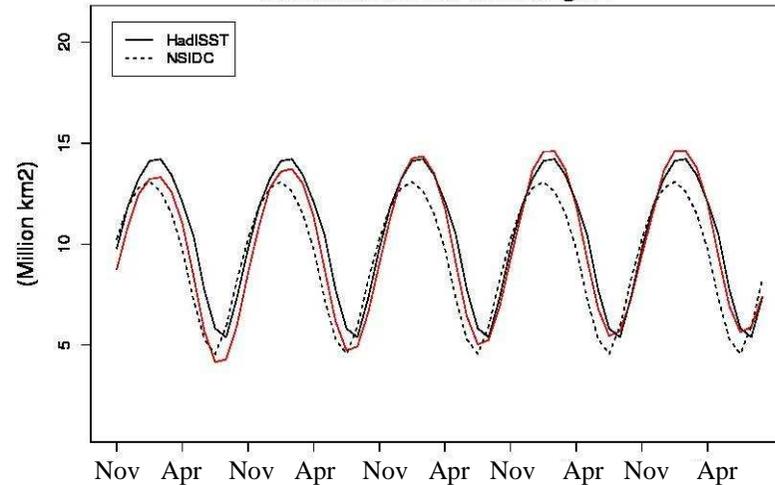

Atmosphere and ocean perturbations

Atmosphere only perturbations

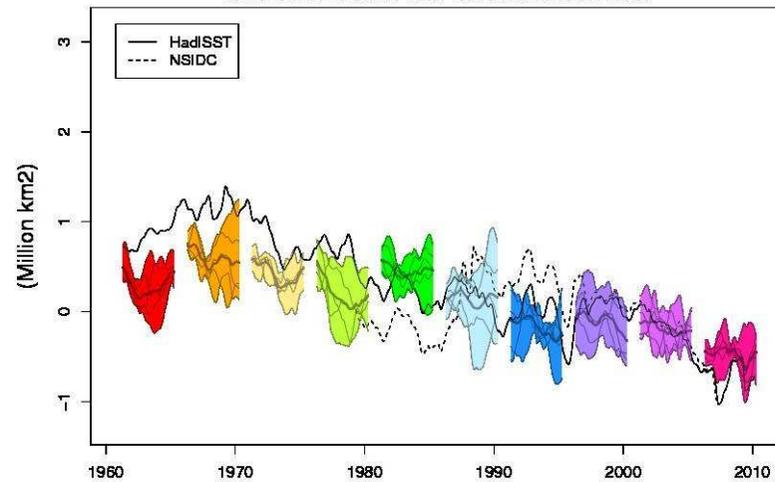

Arctic Sea ice area climatologies

Pair Climatology  
Atm-Oc perturb

Smoothed Arctic Sea ice area anomalies

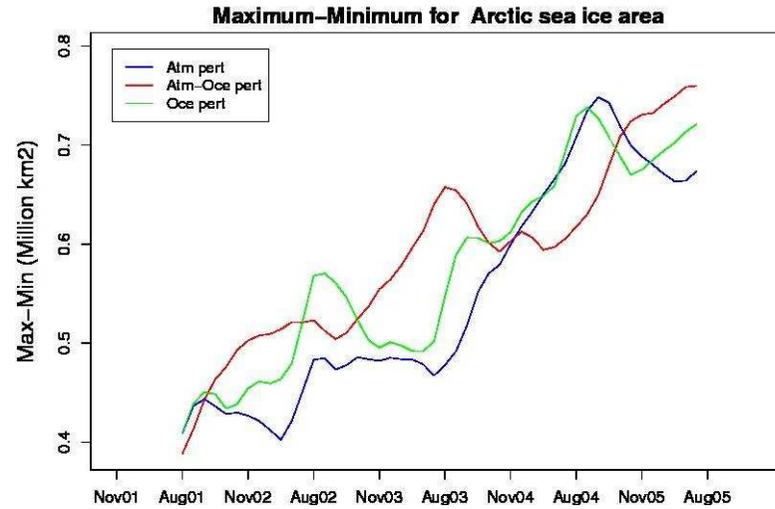

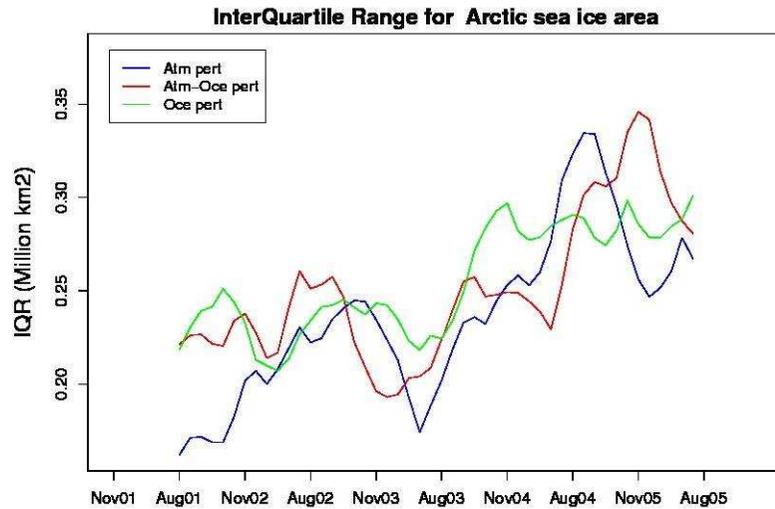

Ocean only perturbations

# Arctic/Antarctic sea ice area

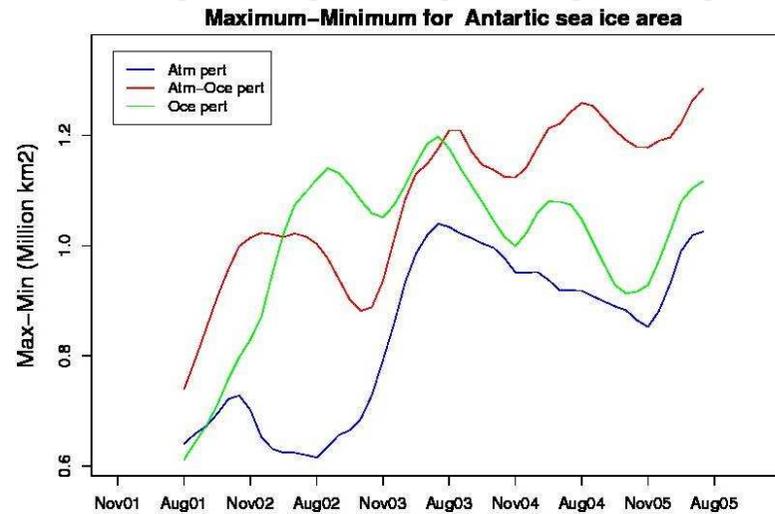

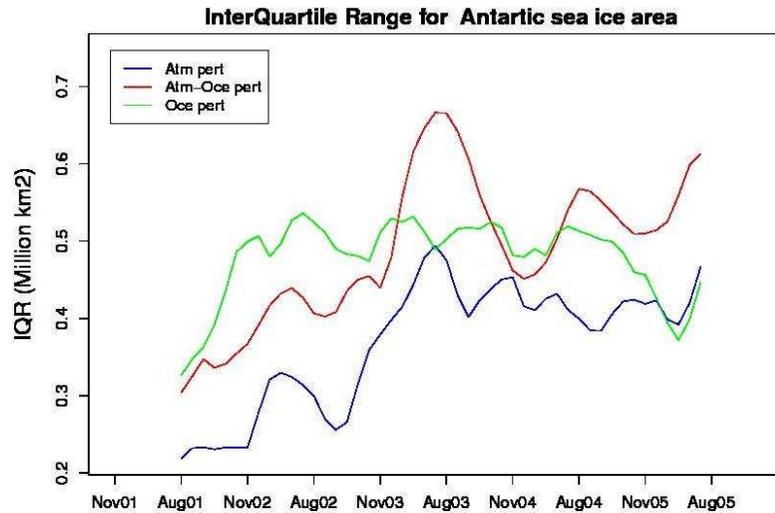

Average over the 10 starting dates of the interquartile range/  
Maximum-minimum of smoothed anomalies

Arctic sea ice area

Arctic sea ice area

Antarctic sea ice area

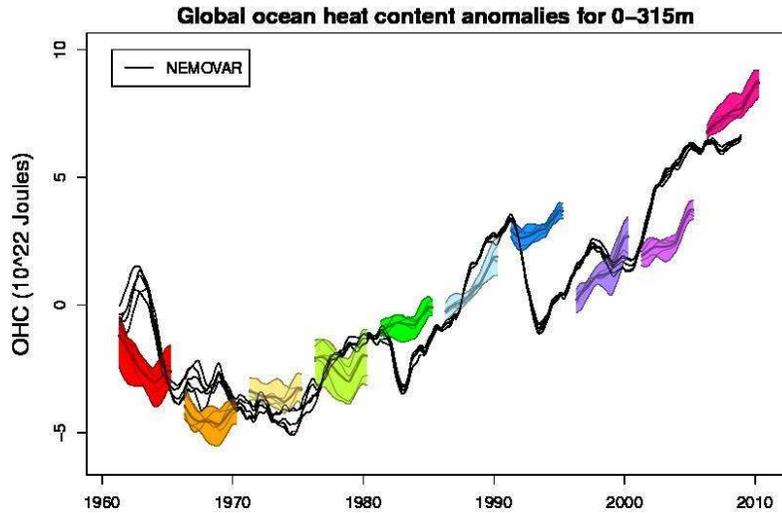

Antarctic sea ice area

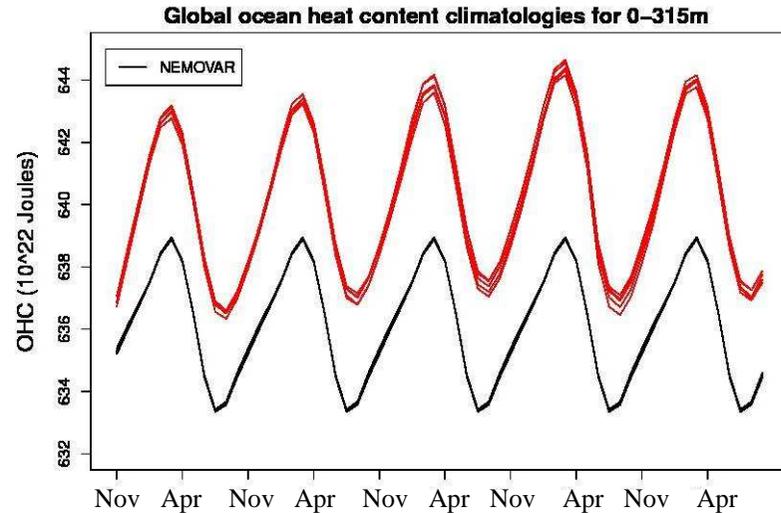

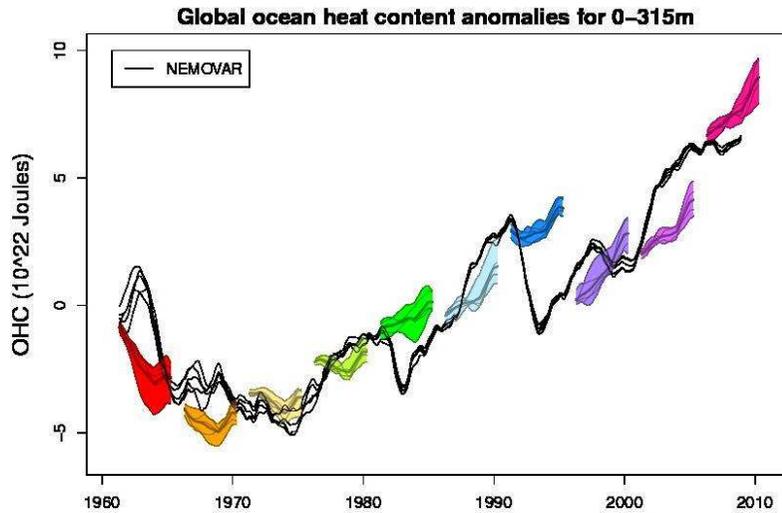

# Global ocean heat content 0-315m

Global-mean 0-315m OHC for EC-Earth v2.2 (pre-SO4 fix).  
Anomalies smoothed out with 12-month running mean.

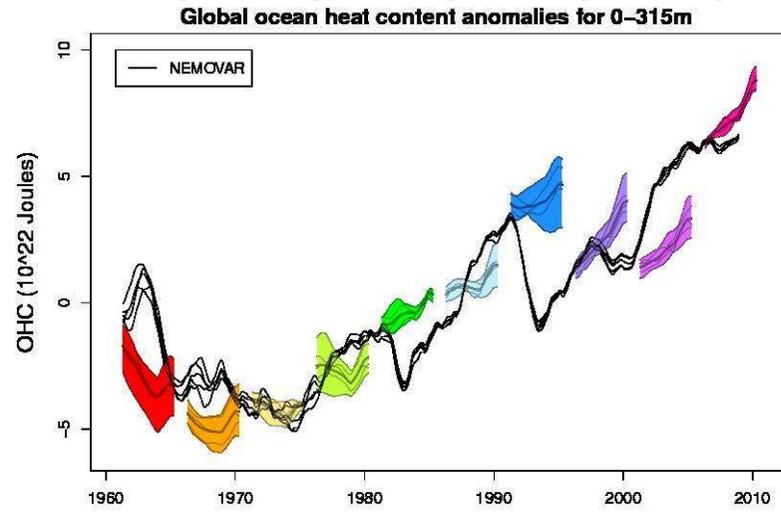

Atmosphere and ocean perturbations

Atmosphere only perturbations

Pair Climatology Atm-Oc perturb

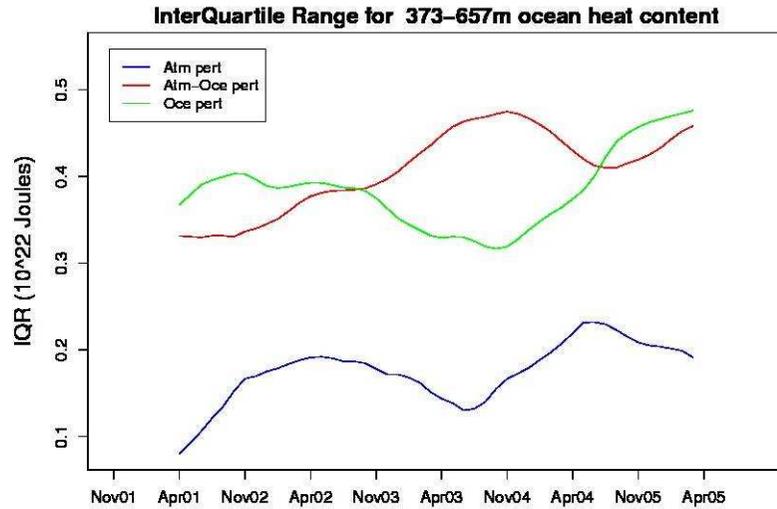

Ocean only perturbations

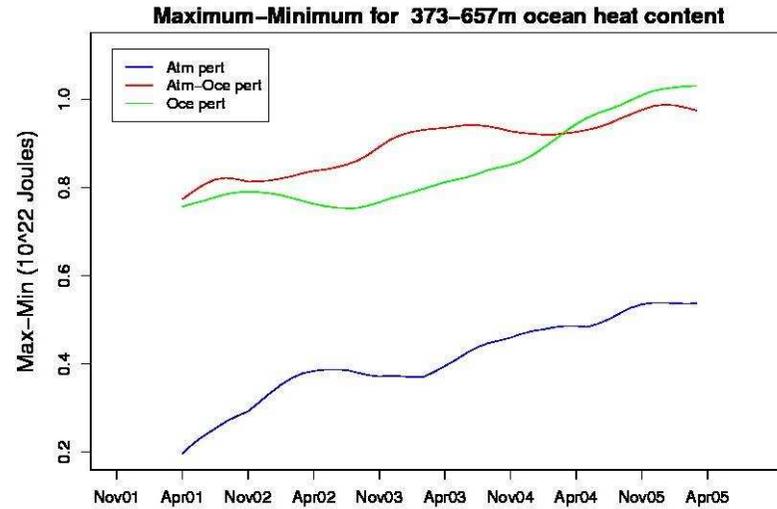

# Global ocean heat content 373m-bottom

Average over the 10 starting dates of the interquartile range/  
Maximum-minimum of smoothed anomalies

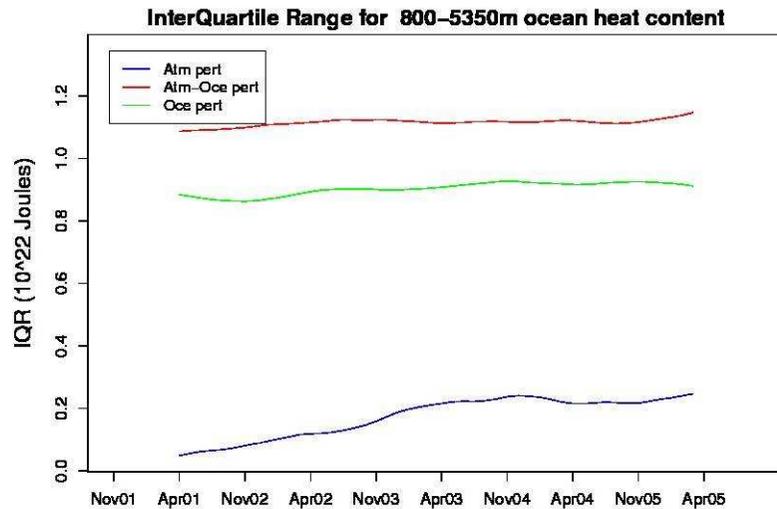

373-657m layer

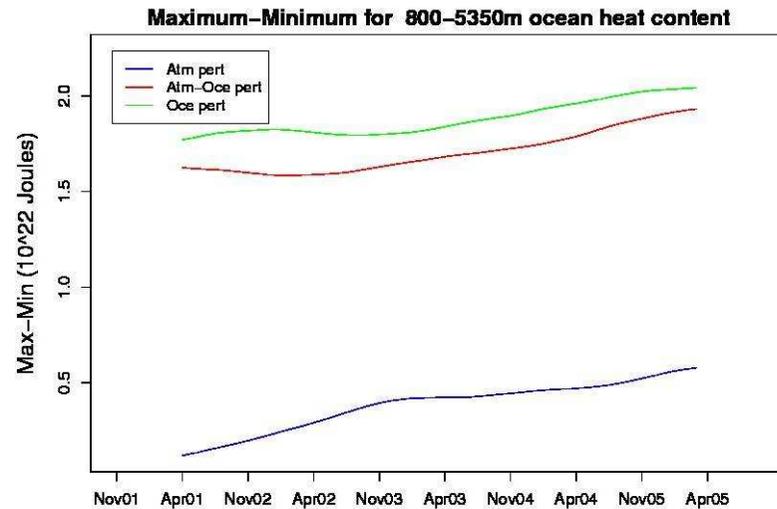

373-657m layer

800-5350m layer

800m-5350m layer

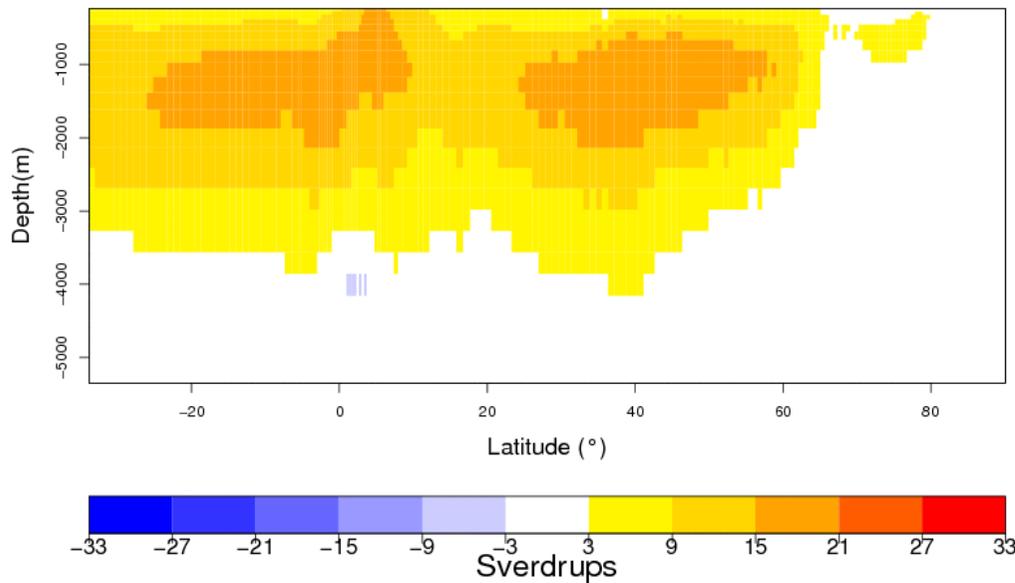

# Atlantic Meridional Overturning Circulation ensemble-mean climatologies : 250m-bottom

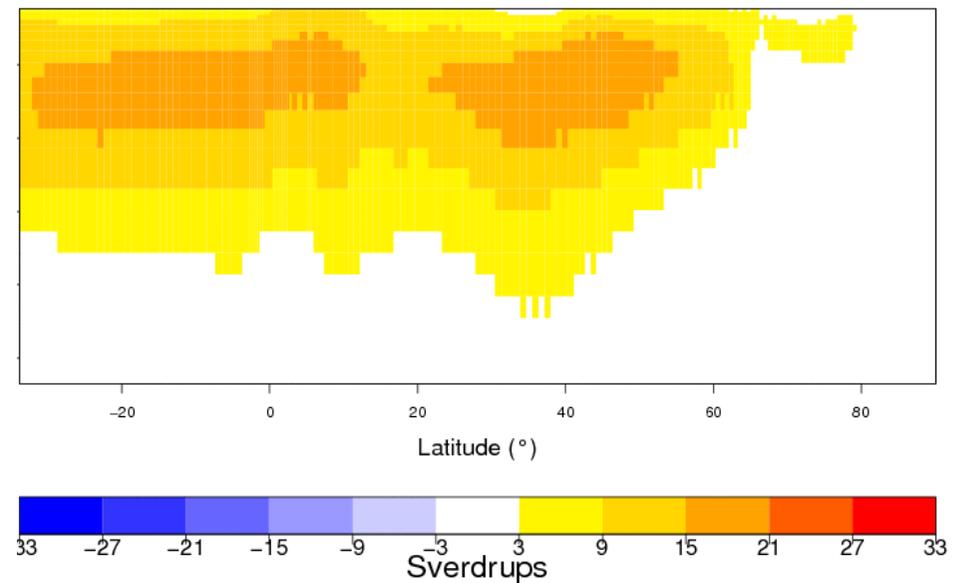

Atmosphere and ocean  
perturbations

NEMOVAR

Merid. Streamfunc. Ensemble-mean Climatol. Time=Nov-00

Merid. Streamfunc. Ensemble-mean Climatol. Time=Nov-00

# Conclusions

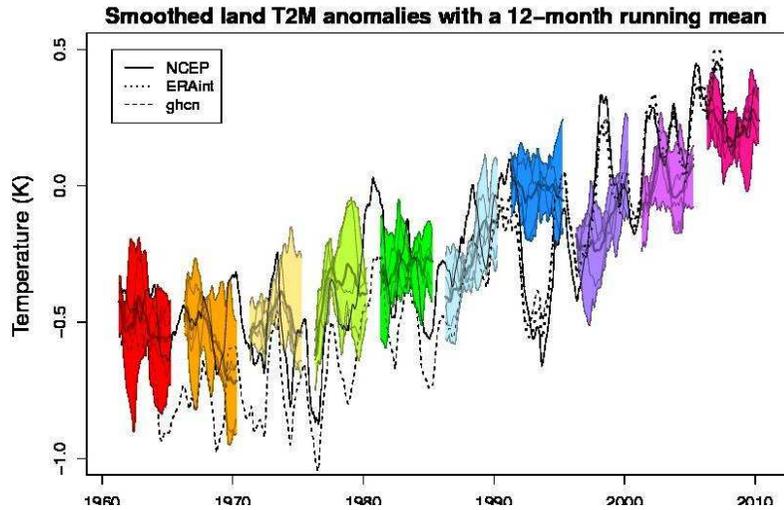

- 1) **Two-metre temperature and SST** : cool bias + better consistency model/reanalysis in 1st half of 20th century + more spread in year 1-3 (1-2) if ocean perturbations
- 2) **Sea ice cover** : more spread if ocean perturbations especially in the Antarctic
- 3) **Global ocean heat content** : warm bias in the upper layer, cold one in the deep ocean + more spread if ocean perturbations especially in the deep layers + bad consistency with reanalysis
- 4) **Maximum of the AMOC** : slightly higher than NEMOVAR reanalysis, late summer maximum more pronounced + spread roughly the same in the 3 experiments + bad consistency with reanalysis

*Thank you for your attention !*

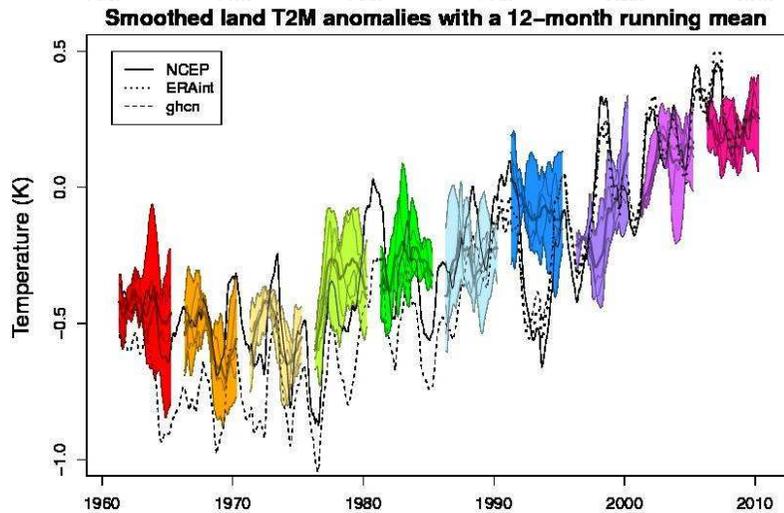

# Land two-metre temperature

Land-only temperature for EC-Earth v2.2 (pre-SO4 fix).  
Anomalies smoothed out with 12-month running mean.

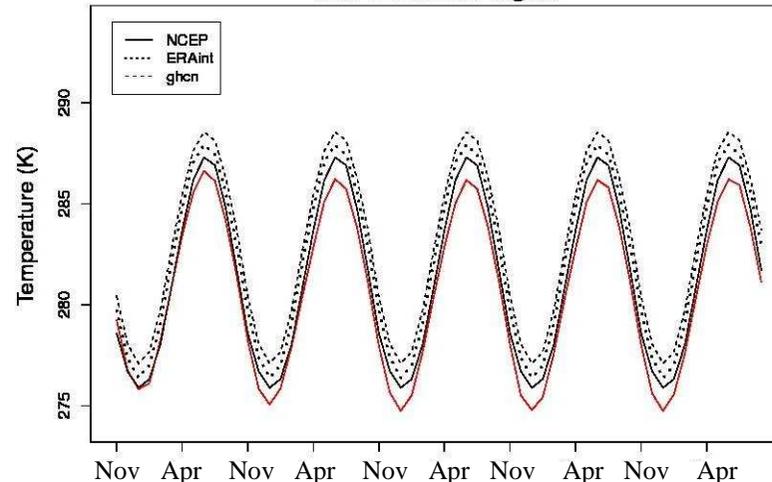

Atmosphere and ocean perturbations

Atmosphere only perturbations

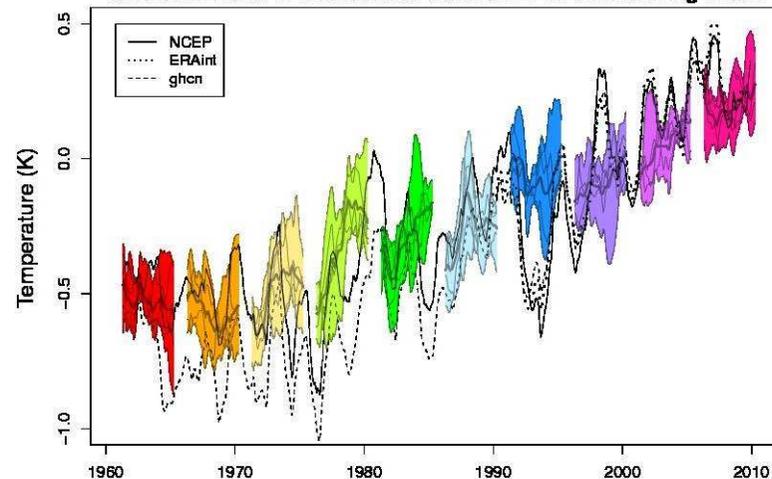

land T2M climatologies

Pair Climatology  
Atm-Oc perturb

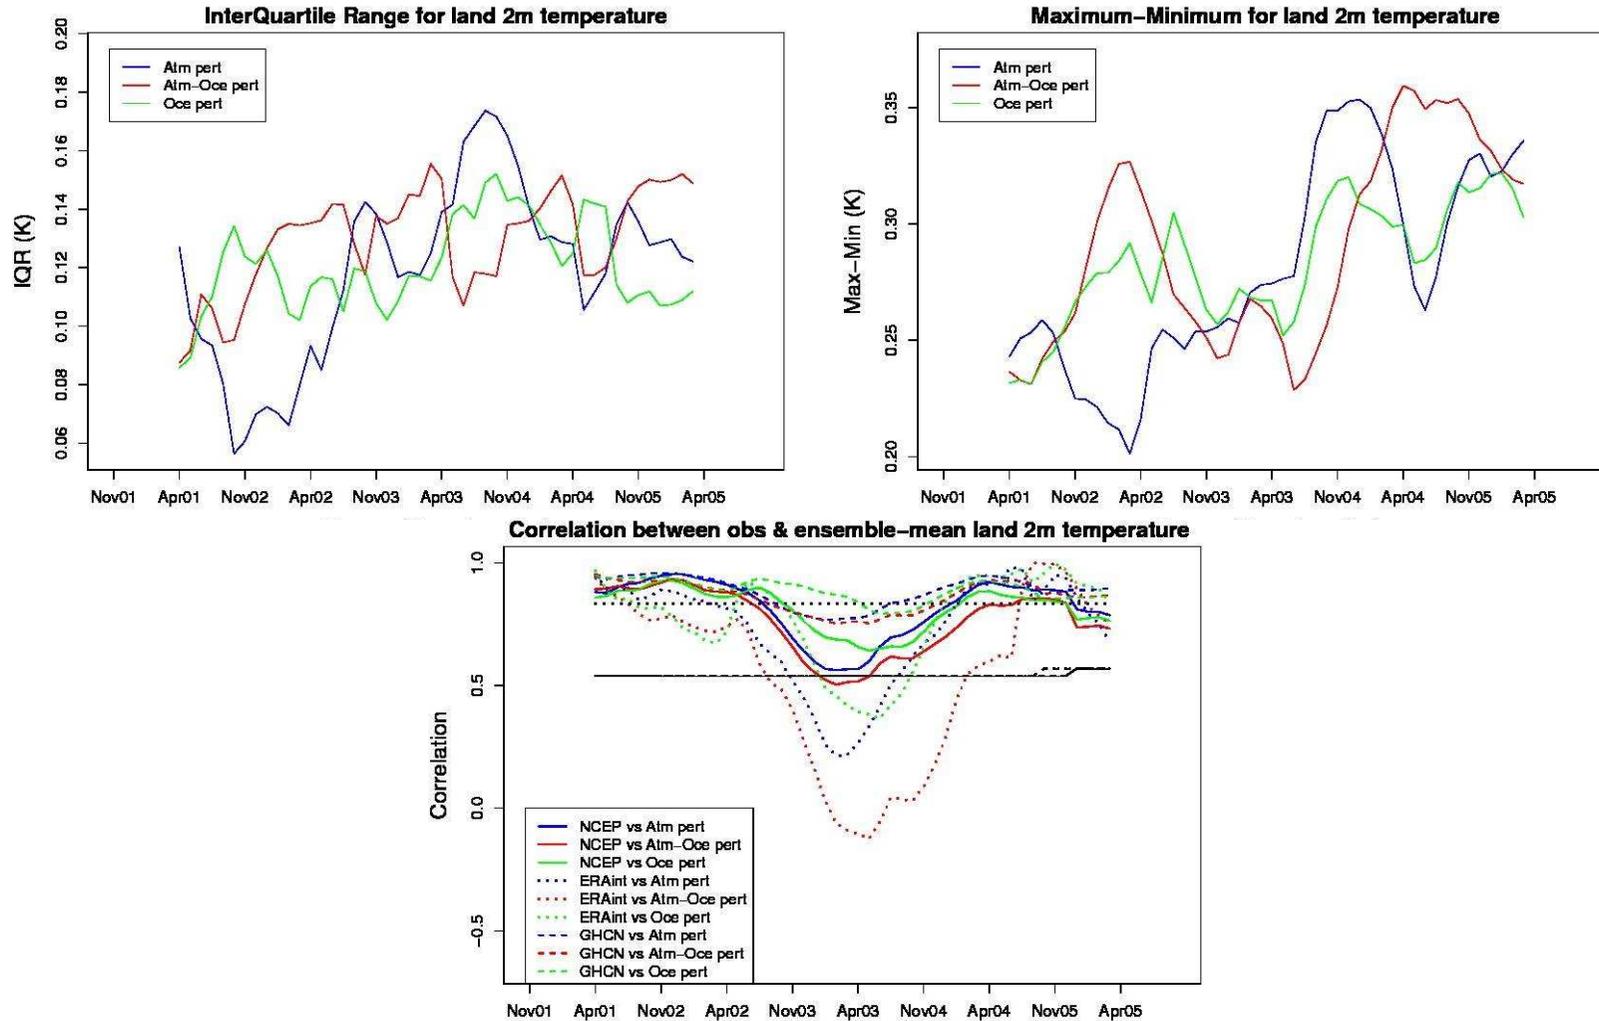

Smoothed land T2M anomalies with a 12-month running mean

Ocean only perturbations

# Land two-metre temperature

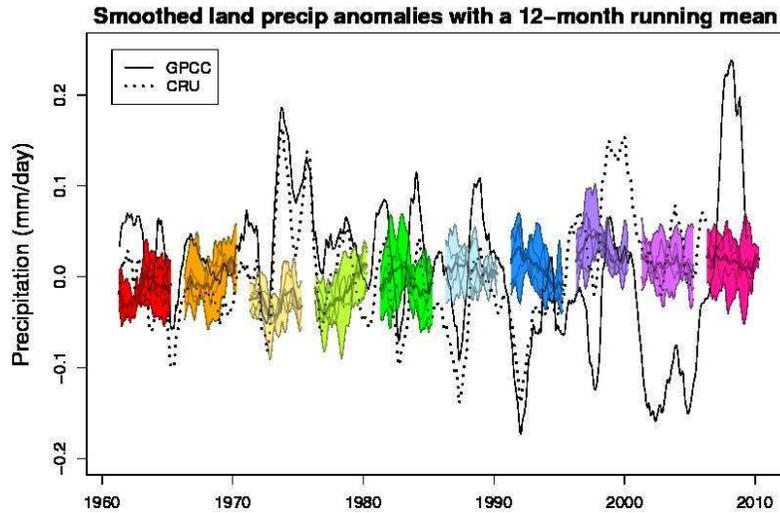

Average over the 10 starting dates of the interquartile range/ Maxi-mini/correlations with reanalyses of smoothed anomalies

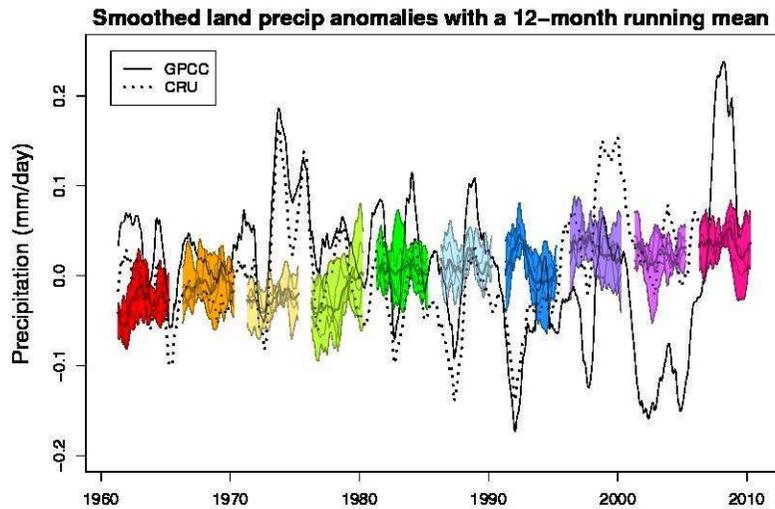

# Land-only precipitation

Land-only precipitation for EC-Earth v2.2 (pre-SO4 fix).  
Anomalies smoothed out with 12-month running mean.
