Seasonal-to-decadal climate Prediction for the  
improvement of European Climate Services

# New co-chair

- Adam Scaife stood down to lead the GC on Near-Term Climate Prediction
- Bill Merryfield new co-chair proposed for approval by the JSC

# Climate-system Historical Forecasting Project (CHFP)

<http://chfps.cima.fcen.uba.ar>

- enable assessments of the seasonal prediction capabilities of many historical forecast systems by the global research community
- provide a record of the evolution of dynamical seasonal forecasting capabilities over time

The screenshot displays the CHFP website interface. On the left, there are logos for WCRP (World Climate Research Programme), CLIVAR (Climate Variability & Predictability Research Programme), and WGSIP (World Global Sea Ice Prediction Project). Below these is a navigation menu with 'HOME' and 'Data Server LOGIN'. The main header is blue and contains the CHFP logo, the text 'The Climate-system Historical Forecast Project Page at Centro de Investigaciones del Mar y la Atmosfera', and the CIMA (Centro de Investigaciones del Mar y la Atmosfera) logo with 'CONICET UBA' below it. A black navigation bar with orange text lists: 'What is CHFP | How to acces to CHFP data | CHFP dataserver at CIMA | Documents and Guides | Contact'. The main content area features a large image of Earth from space. On the right side of this image, there is a dark blue vertical box with the text: 'Welcome', 'CHFP', and 'The Climate-system Historical Forecast Project'. A vertical scrollbar is visible on the right edge of the page.

# Climate-system Historical Forecasting Project (CHFP)

- 14 models
- Hindcast data covering 1960-2014
- Typically 4 start dates Feb/May/Aug/Nov
- Many atmosphere and ocean variables
- Includes Strat-HFP high-top/low-top experiments
- NetCDF (SPECS convention) served via OPeNDAP
- ENSEMBLES database containing seasonal and decadal hindcasts from six European models transferred to CIMA from ECMWF
- **Aim to transfer everything to an ESGF node at CIMA**

**CIMA-CHFP/SHFP**

# New projects: initial shock and drift

- Long-Range Forecast Transient Intercomparison Project (LRFTIP)
- Steered by **William Merryfield** (lead S2D component, Canadian Centre for Climate Modelling and Analysis, Environment and Climate Change, Canada ) and **Mikhail Tolstykh** (lead S2S component, Institute of Numerical Mathematics, Russian Academy of Sciences and Hydrometcentre of Russia)
- Objectives
  1. Develop an online archive of hindcast climatologies and related diagnostics, including for other active research efforts like S2S, DCPD
  2. Address science questions, including influence of different initialization methods on transient , behavior of climate system components, and identification of any impacts (likely negative) on climate forecast quality
  3. Possibly at a later stage: perform hindcast initialization experiments (same model, different initialization methods) that will contribute to (1) and inform (2)

# New projects: initial shock and drift

- Hovmoeller plots of equatorial Pacific SST (initialized-historical)
- Decadal forecasts initialized in January 1961, 1966...2006
- CanCM4 model using two different initialization methods

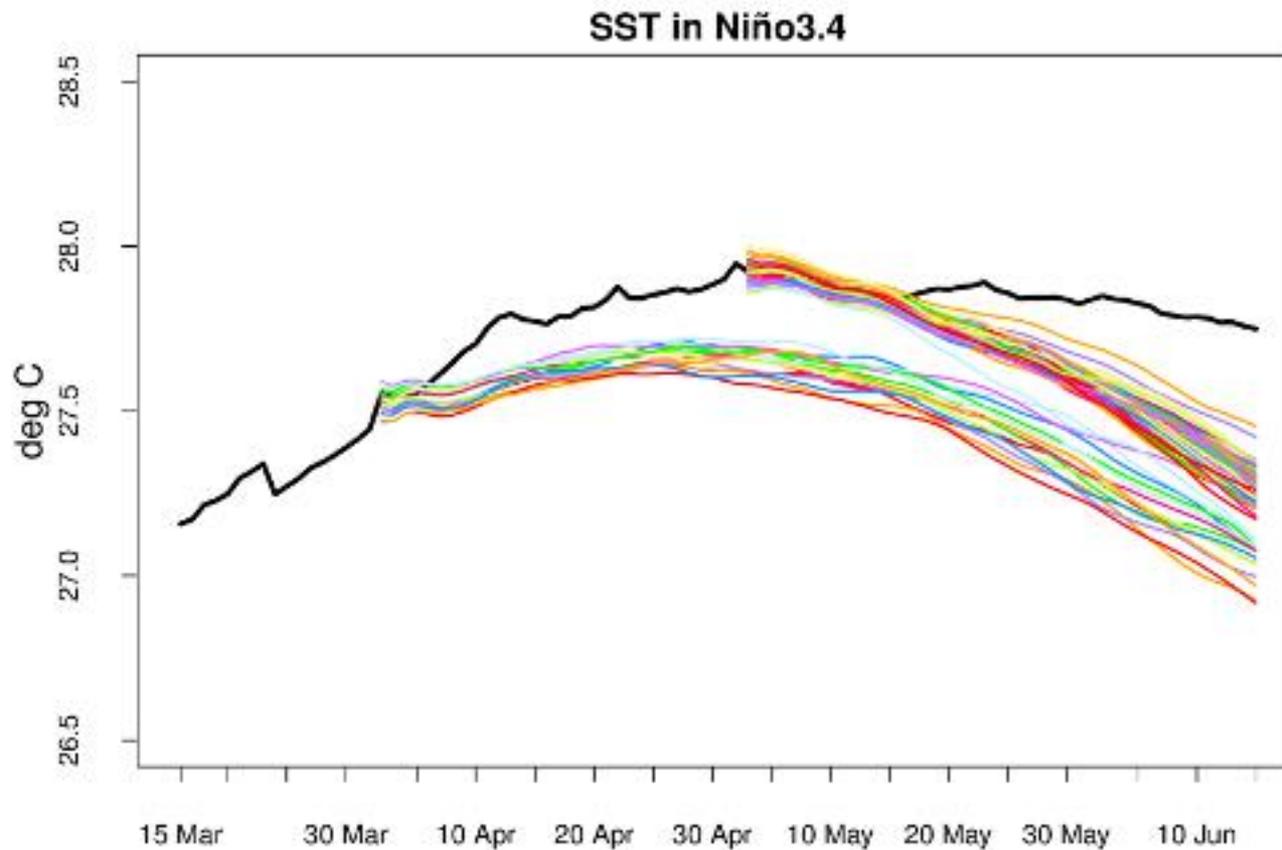

# New projects: initial shock and drift

SPECS/PREFACE/WCRP Workshop on Initial Shock, Drift, and Bias Adjustment in Climate Prediction

10-11 May 2016, Barcelona, Spain

A joint initiative by SPECS, PREFACE and WCRP-WGSIP. A two-day workshop by invitation only.

# New projects: SnowGLACE

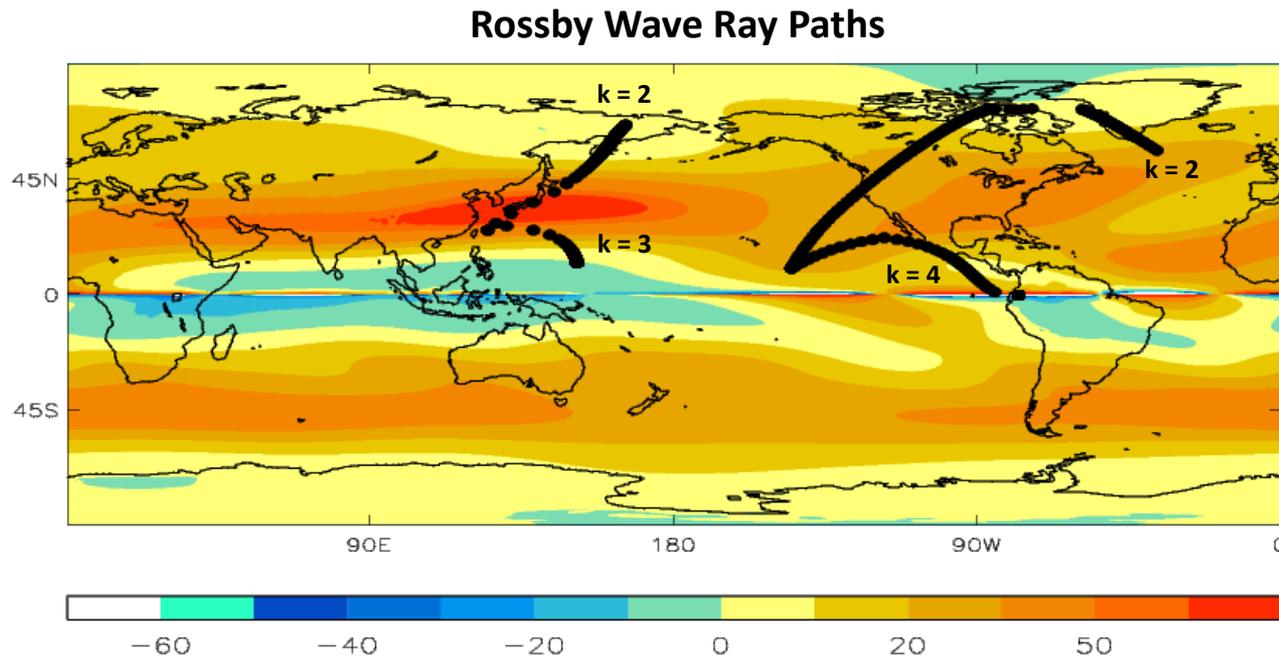

- Impact of snow initialisation on subseasonal-to-seasonal forecasts
- Steered by **Yvan Orsolini** (NILU and Bjerknæs Centre for Climate Research, Norway) and **Jee-Hoon Jeong** (Faculty of Earth Systems & Env. Sciences, Chonnam National Univ., South Korea)
- Links to SnowMIP, PPP and future PolarRCC
- Objectives
  1. Quantify snow initialization impacts on subseasonal-to-seasonal forecasts by evaluating how individual state-of-the-art dynamical forecast systems vary in their ability to extract forecast skill from snow initialization e.g. through stratospheric coupling and influence on the NAO.
  2. Compare twin forecast ensembles with realistic or else some sort of unrealistic snow initialisation (e.g. climatological or “scrambled”); analogous to GLACE 1 and 2 initiatives aimed at assessing the impact of soil moisture on seasonal forecasts; experiments relevant both for the assessment of forecasting skill and attribution of climate variability and extreme events to snow forcing.

# New projects: Teleconnections

- Analyse tropical-extratropical interactions at seasonal and sub-seasonal time scales in different forecast systems and observational data sets using a common framework for a straightforward intercomparison
- Steered by **Laura Ferranti** (ECMWF) and **Adam Scaife** (Met Office, UK)
- Links to similar S2S project
- Objectives
  1. Base the work on the fact that tropical rainfall which is highly predictable drives Rossby waves through upper level divergence; the resulting influence on circulation responsible for substantial portion of extratropical seasonal predictability
  2. Focus on the variability of the NAO and PNA and how they are associated with precipitation, 2m temperature and SST anomalies on a global scale; assess their dependence on the mean climate, seasonal cycle and different phases of ENSO, tropical Atlantic variability, MJO and QBO
  3. Ultimately, assess the ability of forecast systems to skillfully predict tropical precipitation

# New projects: Teleconnections

- Analyse tropical-extratropical interactions at seasonal and sub-seasonal time scales in different forecast systems and observational data sets using a common framework for a straightforward intercomparison

# Lead Centre for Long-Range Forecast Multi-Model Ensembles (WMO LC-LRFMME)

<http://www.wmolc.org>

- Global Producing Centres contribute their data to the LC-LRFMME
- Collaboration with WGSIP has been requested for many years through ET-OPSLs
- However, no access for research outside the GPCs is given to the hindcasts or past forecasts, not even in graphical form to non-met service users

# Global Seasonal Climate Update (GSCU)

<http://www.wmo.int/pages/prog/wcp/wcasp/GSCU.html>

- The GSCU is produced by a small group lead by the CCI and CBS
- WGSIP feedback has been requested
- No access to the GSCU is granted to non-met service institutions, although the GSCU web site says otherwise

WORLD METEOROLOGICAL ORGANIZATION  
Commission for Climatology

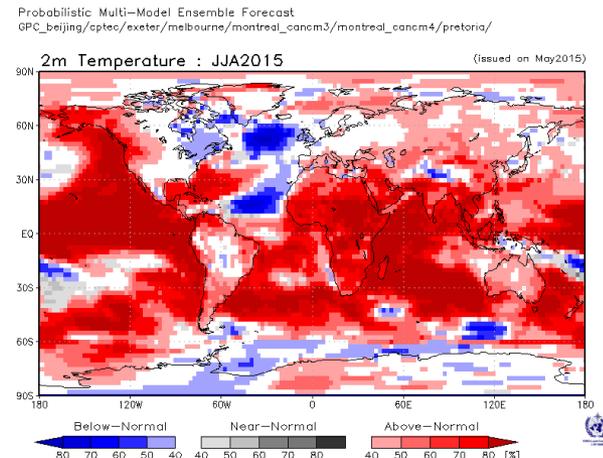

## Global Seasonal Climate Update

(TRIAL PHASE)

Issued: May 2015

Target Season: June-July-August 2015

Summary

# Proposed WGSIP/ET-OPSLS subgroup

- Periodically reports to ET-OPSLS (timing to be determined) about potential new societally useful forecast products identified by research community
- ET-OPSLS may submit requests for a brief assessment of the current state of knowledge regarding a product of interest
- Assessments to include
  1. brief descriptions of the product itself, its potential societal usefulness (e.g. target regions/sectors), data variables and frequency required
  2. summary of existing evidence including references that the product can be predicted skillfully
- Assessments will be revisited and possibly updated with each reporting cycle until product is adopted or indicated not to be of interest by ET-OPSLS
- Alternative: instead of subgroup, WGSIP-wide activity identified in Terms of Reference

# Decadal prediction

- Organised by the Decadal Climate Prediction Project (DCPP) panel
- Designed the CMIP6 contribution in 3 components with WGCM and CLIVAR
- **Fundamental transfer data dissemination technology of component B -> CCI/CBS**
- Meetings in Aspen last summer (component C) and in Barcelona in May (final design and coordination)

Table 1. Basic CMIP-decadal experiments

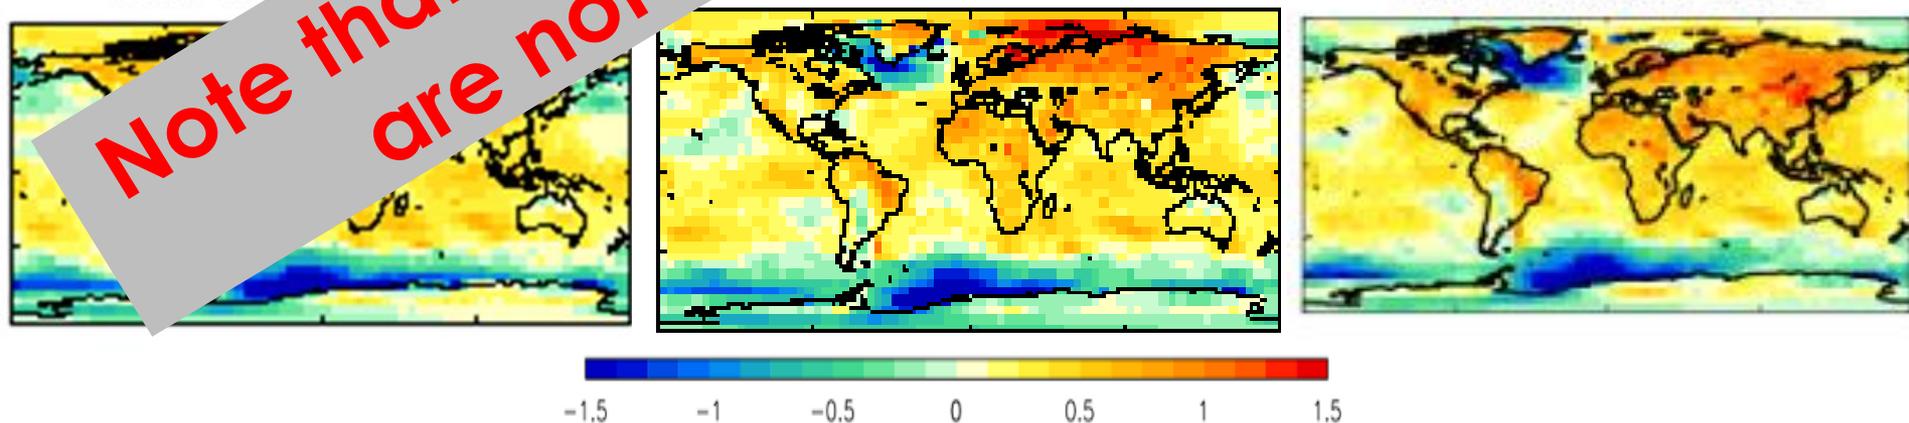

#	Experiment	Notes	# of years
<b>PRIORITY 1: Hindcast/forecast information</b>			
1.	Ensembles of at least 5-year, but much preferably 10-year, hindcasts and forecasts	<p>Coupled models with initialization based on observations</p> <p>Start date every year from 1960 to the present</p> <p>Start date on or before 31 Dec of the year preceding the forecast period (start dates on or before Nov 30 allow DJF seasonal forecast results and are recommended)</p> <p>10 ensemble members preferred (more if possible)</p> <p>Prescribed historical values of atmospheric composition and/or emissions (and other conditions including volcanic aerosols) and the RCP4.5 scenario (or its replacement) in future years</p>	60x10x(5-10) =3000-6000yrs
<b>PRIORITY 2: To quantify the effects of initialization</b>			
2.	Ensembles of historical climate simulations Made with same model as used for hindcasts	<p>1850 to present with initial conditions from a preindustrial control simulation</p> <p>10 ensemble members preferred (more if possible)</p> <p>Prescribed historical and future forcing as for Experiment 1</p>	170x10 =1700yrs

# Decadal prediction

- Component B focuses on decadal forecasts (not hindcasts), which are being made by a number of groups. It proposes a decadal prediction with the aim of the collection, calibration and combination
- Component C focuses on the mechanisms responsible for decadal predictability and permitting (or making difficult) high quality
  - 1. Specific modes (North Atlantic, CVP)
  - 2. Specification and impact (link to VolMIP)
- Important data issues exist, double time axis -> **problems to link to the WIP**

(D) Five year mean forecast from November 2013

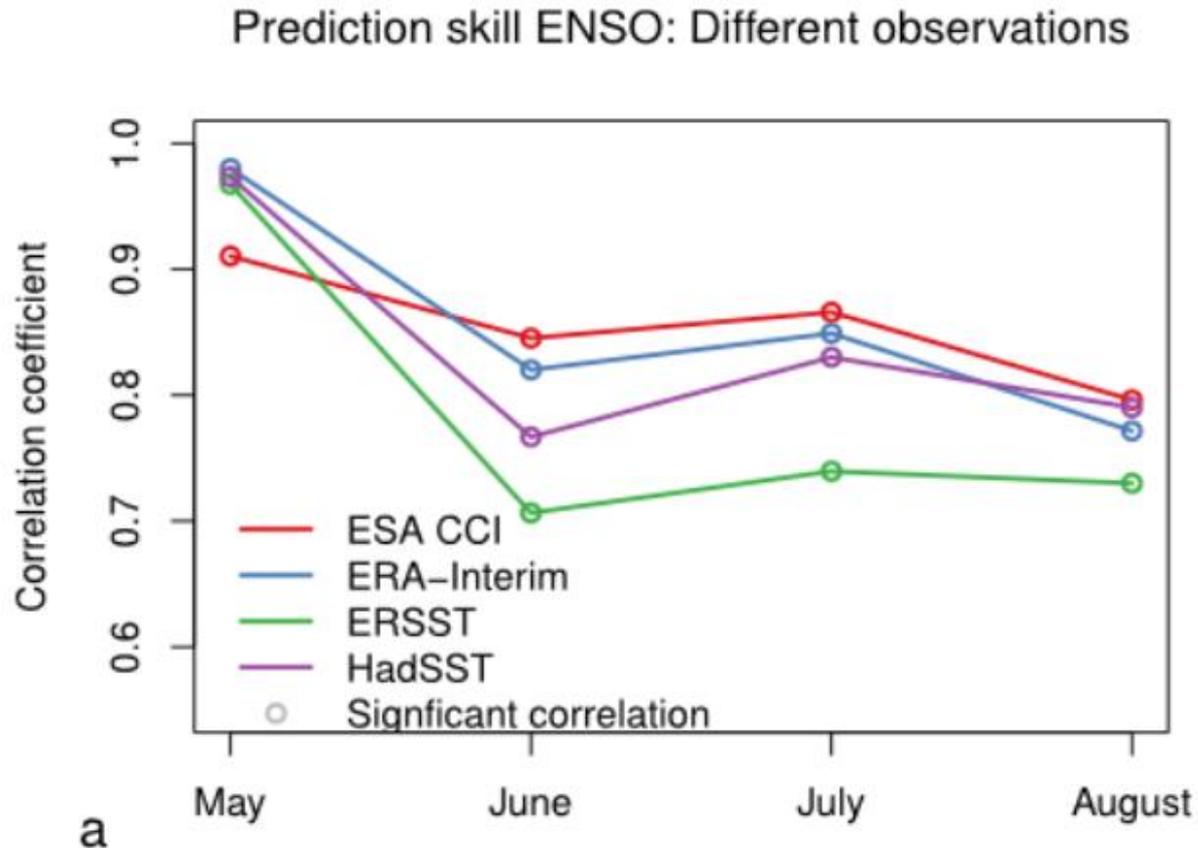

(A) Five year mean forecast from November 2014

**Note that many contributors to component B are not Global Producing Centres**

# Observational uncertainty

Predictions with EC-Earth3 started every May over 1993-2009 with ERAInt and GLORYS2v1 initial conditions, and internal sea-ice reconstruction.

# Increased resolution

- Lots of work going to global forecast systems with resolutions of around 25-50 km.
- Build on what is being done in other communities (WGNE, HiResMIP). Weather forecast systems (high resolution) moving towards coupling from day 1.
- Huge amount of work to be done in the initialisation part. Ensembles should also be large enough as forecast quality depends heavily on ensemble size. Lots of computing time and technical ability required. However, good for flagship computational projects.
- Increased resolution does not automatically improve forecast skill (even if the mean climate looks nicer).

# Other links

- Polar Prediction Project: polar-lower latitudes linkages (after the hosting of the PPP-WCRP workshop in December 2014)
- GC on Extremes: participation in workshops, training and the WCE special issue
- Climate services: GFCS, CSP, RCOFs (attended the November meeting on operational climate prediction in Pune)
