# EC-Earth3.2 at the BSC-ES

François Massonnet

and the Climate Prediction Group

R. Bilbao, O. Bellprat L. Brodeau, R. Cruz-García, F. Doblas-Reyes, E. Exarchou, N. Fučkar, J. García-Serrano, V. Guemas, M. Ménégoz, C. Prodhomme, V. Sicardi, E. Tourigny

- ORCA1L75
  - Runs in seasonal prediction mode
  - Stratospheric aerosols are being added (M. Ménégóz)
- ORCA025L75
  - Many compatibility issues were fixed (see portal): bathymetry, closed seas, ...
  - Does not run beyond 20 time steps, trying with short time step.
- PRIMAVERA & HighResMIP formatting: ongoing (E. Tourigny)
- Reproducibility tests are underway (Massonnet, Ménégóz, Acosta)
- More to follow at the EC-Earth meeting

# The EnKF in EC-Earth3.2

François Massonnet

and the Climate Prediction Group

R. Bilbao, O. Bellprat L. Brodeau, R. Cruz-García, F. Doblas-Reyes, E. Exarchou, N. Fučkar, J. García-Serrano, V. Guemas, M. Ménégos, C. Prodhomme, V. Sicardi, E. Tourigny

1. What is an ensemble Kalman Filter (EnKF)?
  1. What is the scientific purpose of an EnKF?
  2. What are possible applications of the EnKF in climate sciences?
  3. What are the advantages and downsides wrt other methods?
2. How does an EnKF work?
  1. How does it affect the workflow?
  2. Is it dependent on the version of EC-Earth used?
  3. What happens with the ocean when sea ice is assimilated?
3. How much extra resources does the EnKF require?
  1. What is the typical length of an assimilation cycle?
  2. What is the space required to save the experiment?
  3. Can we run with less than 25 members?
4. What is the status of the EnKF in EC-Earth?
5. What are the plans of the EnKF in EC-Earth?

## 1. What is the scientific purpose of an EnKF?

A Kalman Filter (KF) is a multivariate statistical problem of state estimation by maximizing the posterior state distribution, given observations, assuming bias-free models and observations and gaussian distribution of errors.

*Every word is  
important!!!*

## 1. What is the scientific purpose of an EnKF?

A Kalman Filter (KF) is a multivariate statistical problem of state estimation by maximizing the posterior state distribution, given observations, assuming bias-free models and observations and gaussian distribution of errors.

An **EnKF** works as a KF, but uses **ensembles** to estimate prior uncertainty

## 2. What are possible applications of the EnKF in climate science?

- A. State estimation for reconstruction (reanalyses)
- B. State estimation for initialization (initial conditions)
- C. Parameter estimation (tuning/calibration)

Three « hot » questions of climate science are addressed with the same tool! How cool is that?

This was the subject of my thesis, see references.

## 3. What are the advantages and downsides w.r.t. other methods?

	Nudging	Variational (3D/4D Var)	Sequential methods (EnKF)	Particle filtering
<i>Ease of implementation</i>	Fair	Hard (coding adjoint)	Medium-Hard	Medium
<i>CPU consumption</i>	Low	Low-Medium	High (~20-50 members)	Very high (~100 members to avoid degenerate solution)
<i>Needs changes in model code?</i>	Yes (restoring term added to tendencies)	Yes (adjoint)	No	No
<i>Physical consistency</i>	Little (univariate)	Up to linear approximation	Up to linear approximation	Full consistency
<i>Estimation of prior uncertainty</i>	None	Static	Dynamic	Dynamic
<i>Assumptions to reach optimality</i>	Not defined as an optimization problem	Gaussian centered errors	Gaussian centered errors	None
<i>Produces ensembles?</i>	No	No	Yes (hence available as IC)	Yes (hence available as IC)

The EnKF is, all in all, a honest tradeoff to estimate a system state with satisfactory physical consistency given limited resources available

## 1. How does it affect the workflow?

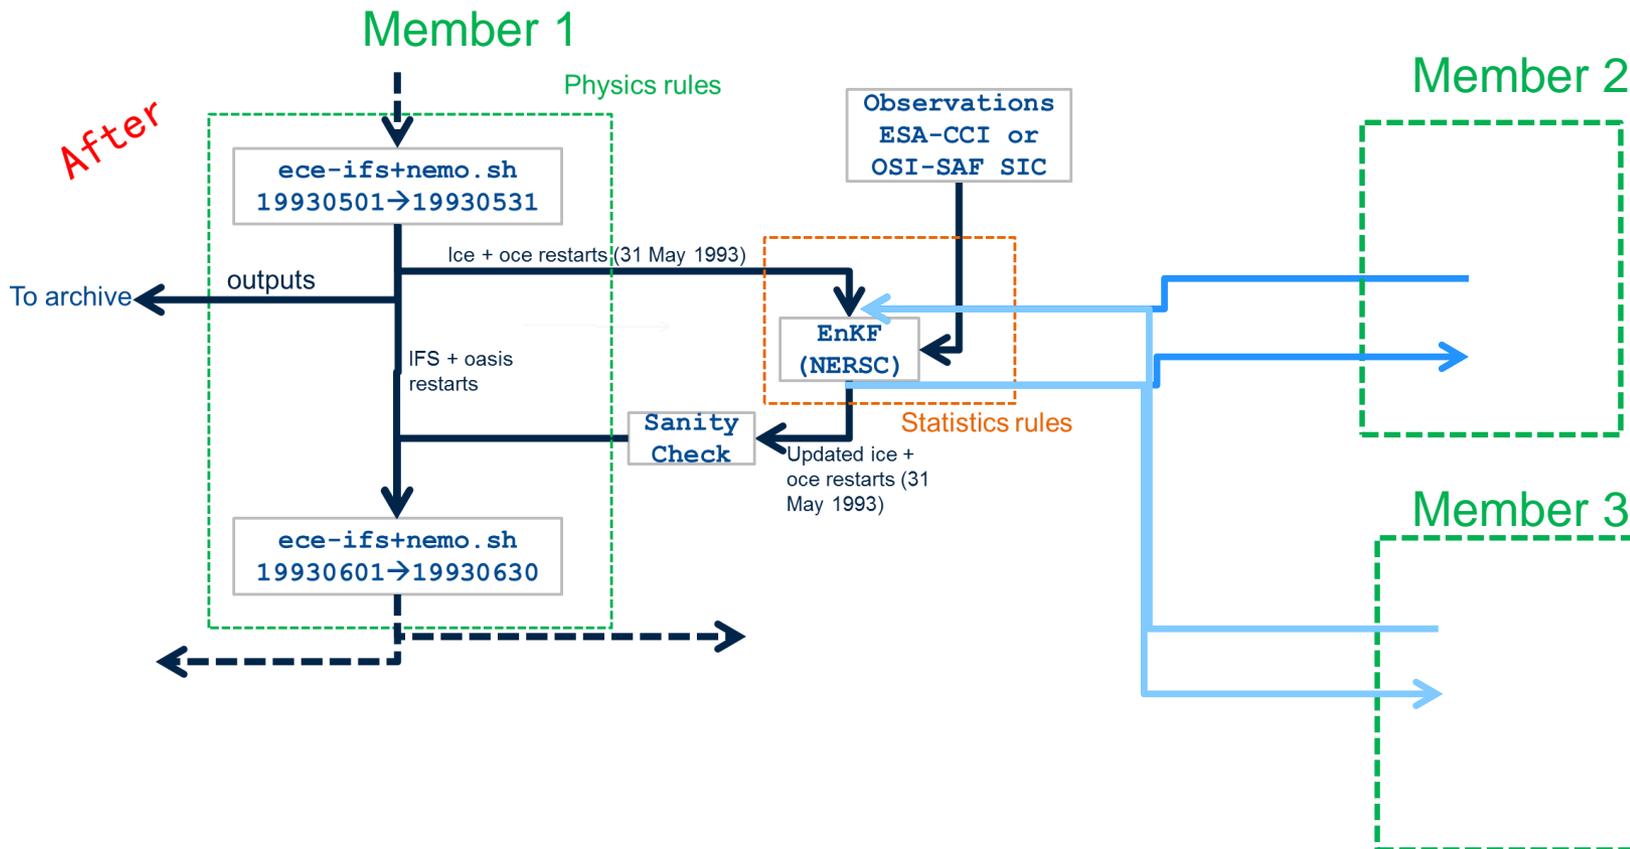

# How does an EnKF work?

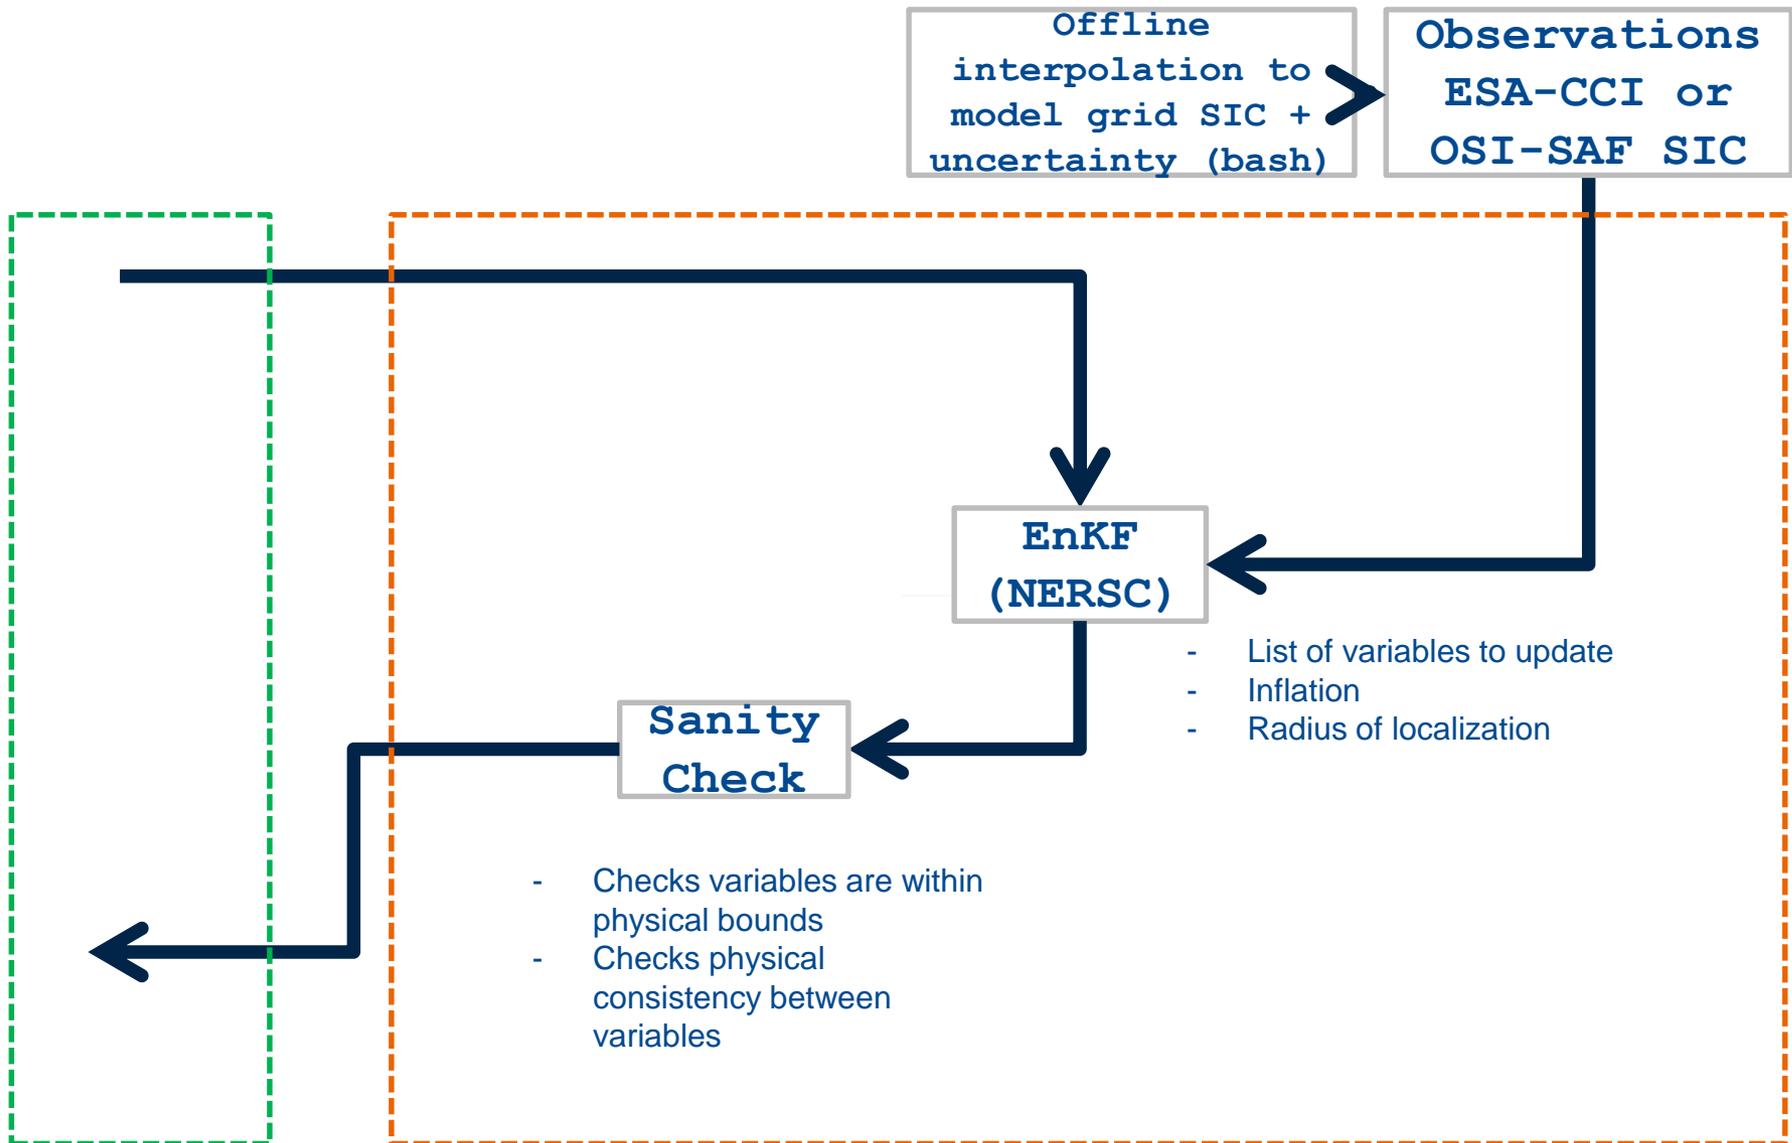

## 1. How does it affect the workflow?

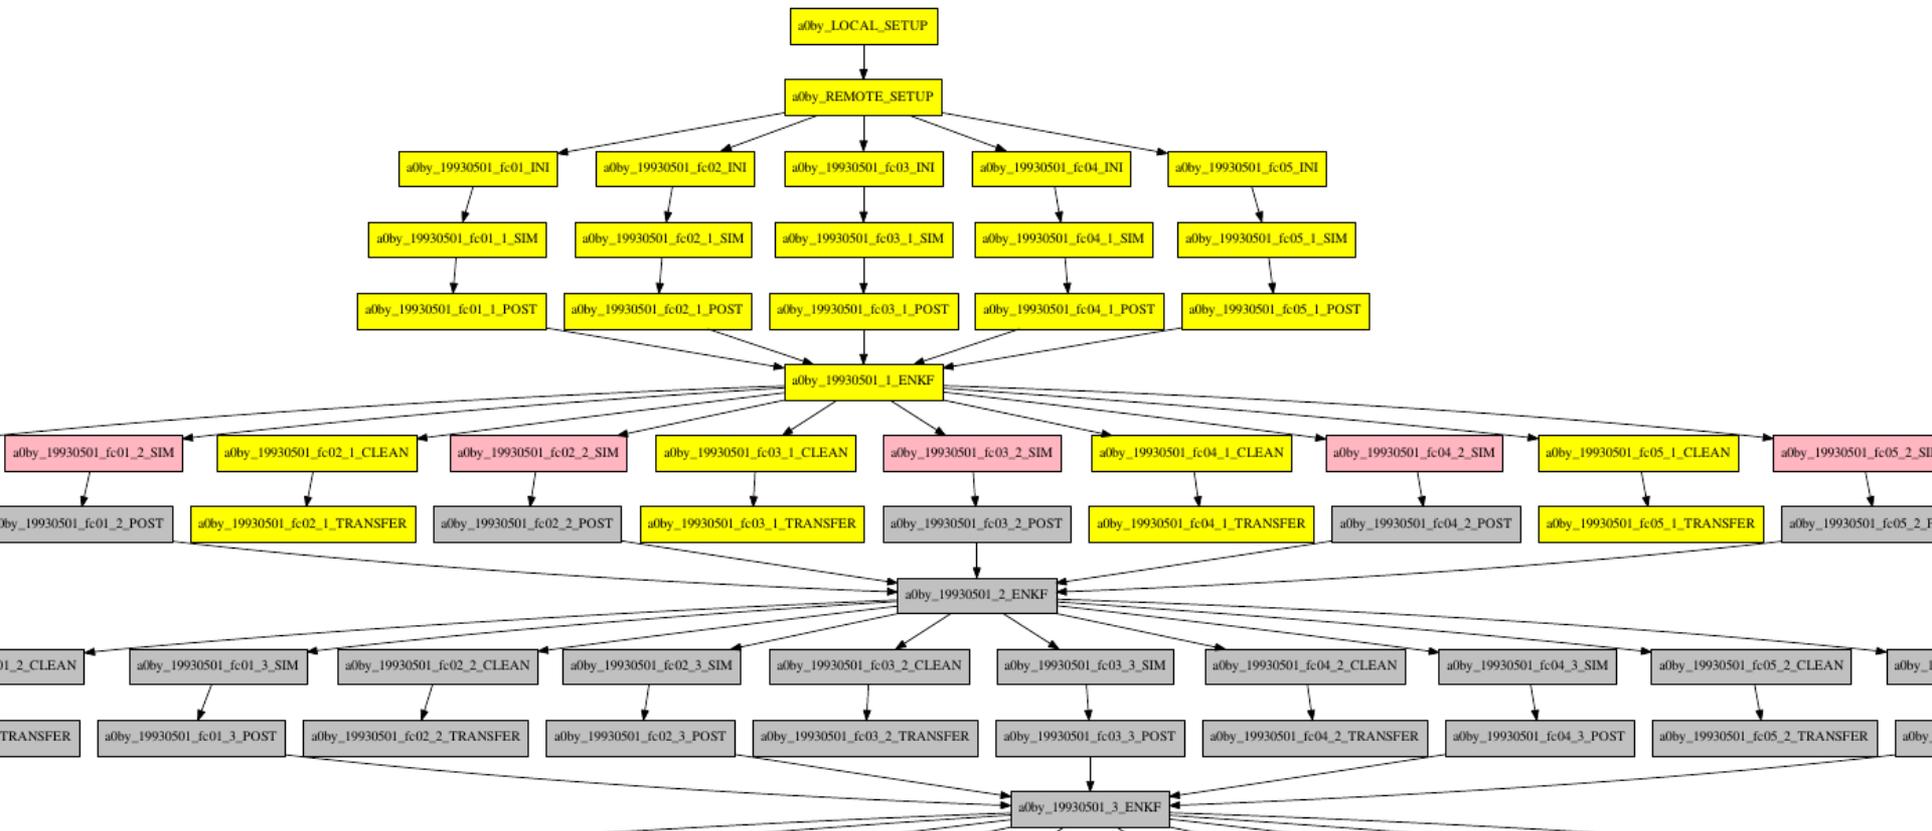

# How does an EnKF work?

# How does an EnKF work?

## Implementation in a workflow manager: Autosubmit

## 2. Is it dependent on the version of EC-Earth used?

NO, unless state variables are added, deleted or renamed in EC-Earth

## 3. What happens to the ocean when sea ice is assimilated

To cut a long story short, all oceanic variables and sea ice variables are updated even though only SIC is assimilated.

The update of each variable (T, S, U, V, ...) is based on the relationship it has with SIC, learned from the ensemble.

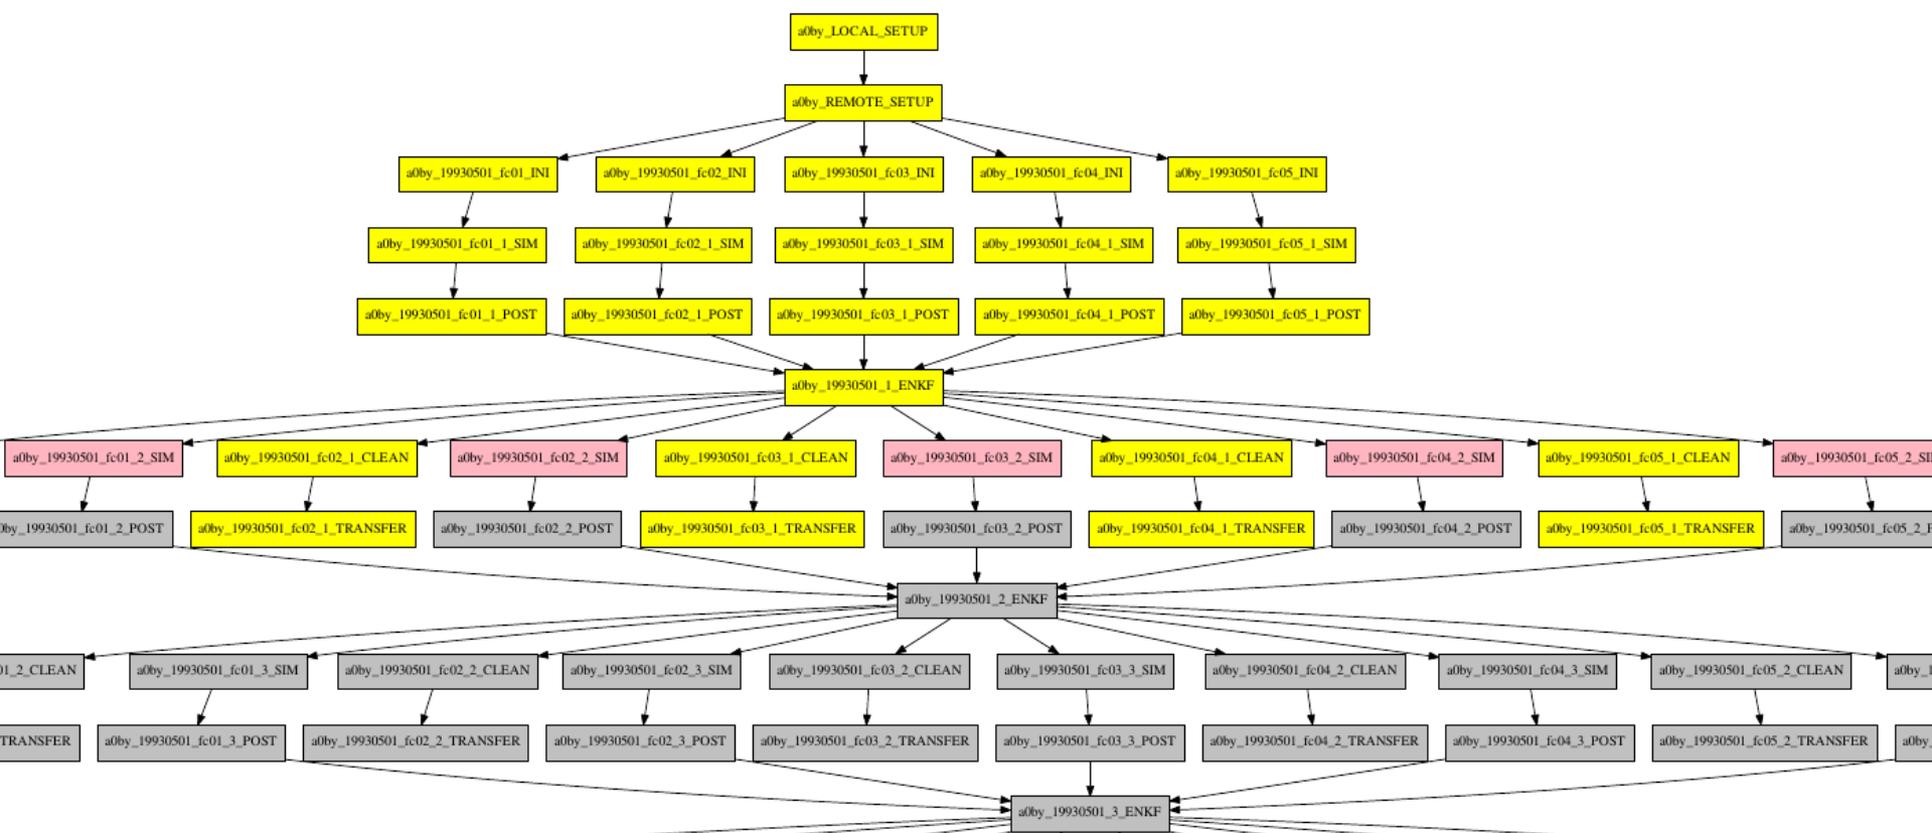

This guarantees a state that is consistent up to the linear approximation.

  2. Is it dependent on the version of EC-Earth used?
  3. What happens with the ocean when sea ice is assimilated?
3. **How much extra resources does the EnKF require?**
  1. What is the typical length of an assimilation cycle?
  2. What is the space required to save the experiment?
  3. Can we run with less than 25 members?
4. What is the status of the EnKF in EC-Earth?
5. What are the plans of the EnKF in EC-Earth?

# How much extra resources does the EnKF require?

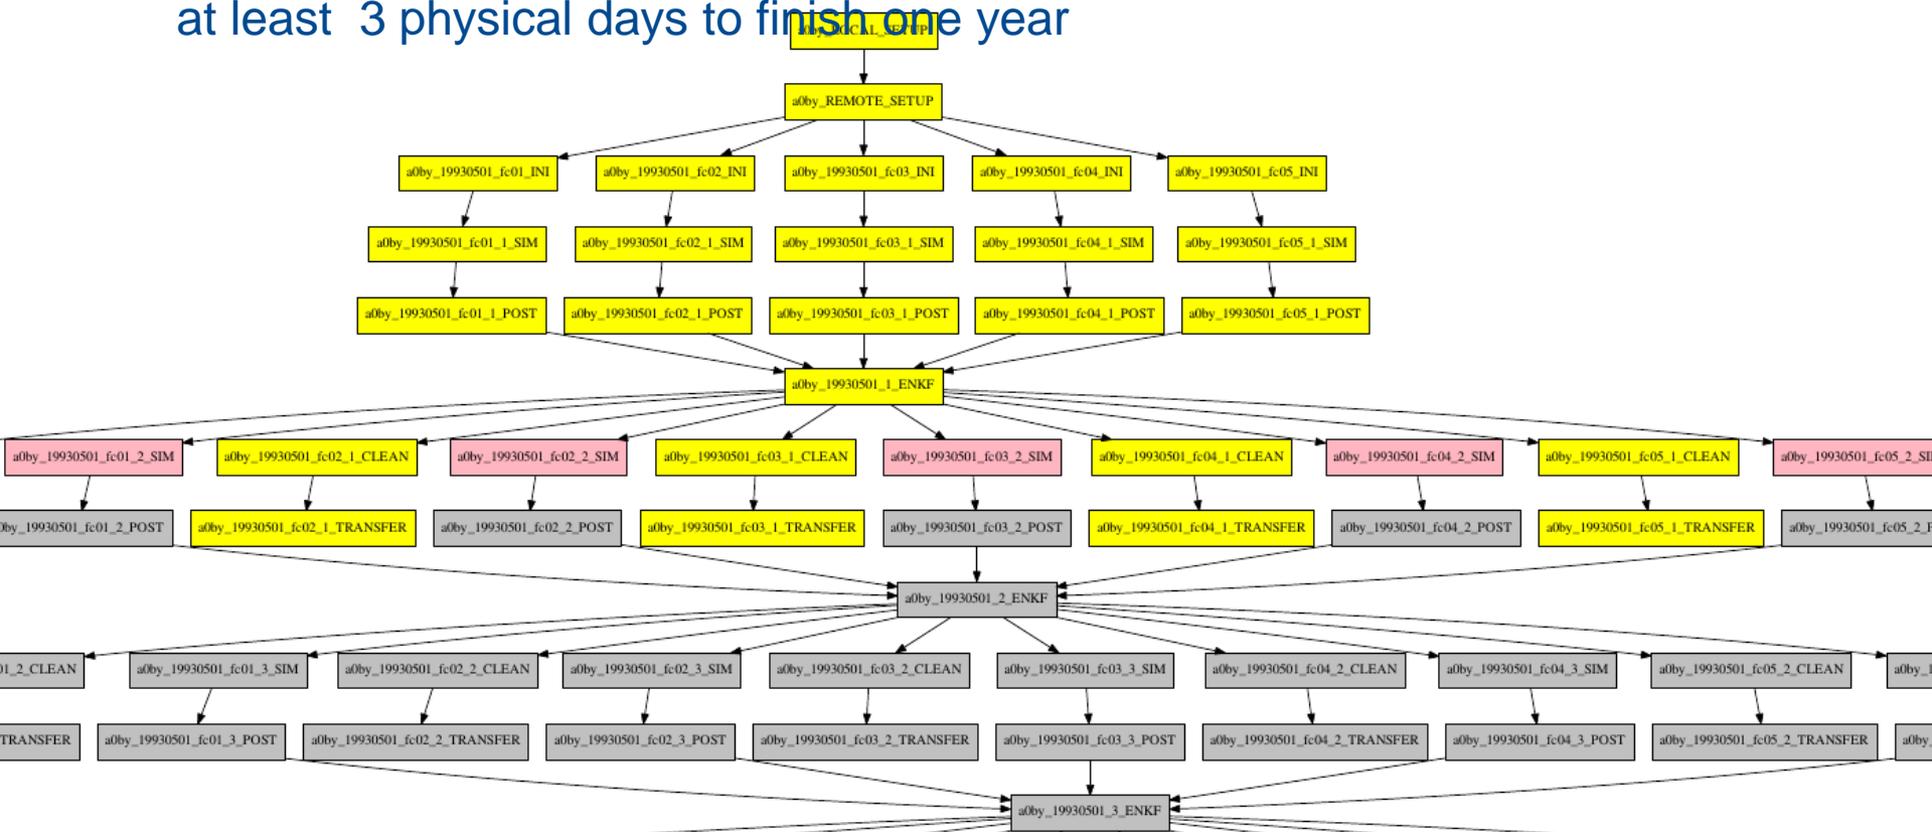

- There are  $N=24$  members to integrate, hence 24 SIM jobs, but all 24 jobs can be submitted independently.
- The EnKF job is itself quite fast (15 min on 16 procs) but cannot start until the last of the 24 SIM jobs is finished 😞. That's the bottleneck of sequential methods.

# How much extra resources does the EnKF require?

- At ORCA1L75 with EC-Earth3.2:
  - CPU consumption is  $\sim 24$  [members]  $\times$   $432$  [procs]  $\times$   $0.2$  [hrs] = **2 kCPUhrs per cycle**. (one cycle = one month here). This makes  **$\sim 0.8$  million CPUhrs for producing initial conditions over a full period**. CPU consumed during EnKF jobs is negligible.
  - At ORCA1, with EC-Earth3.2, it takes between 2 hours and 5 hours of physical time (depending on load on machine) to complete a full SIM-EnKF cycle. Expect at least 3 physical days to finish one year

# How much extra resources does the EnKF require?

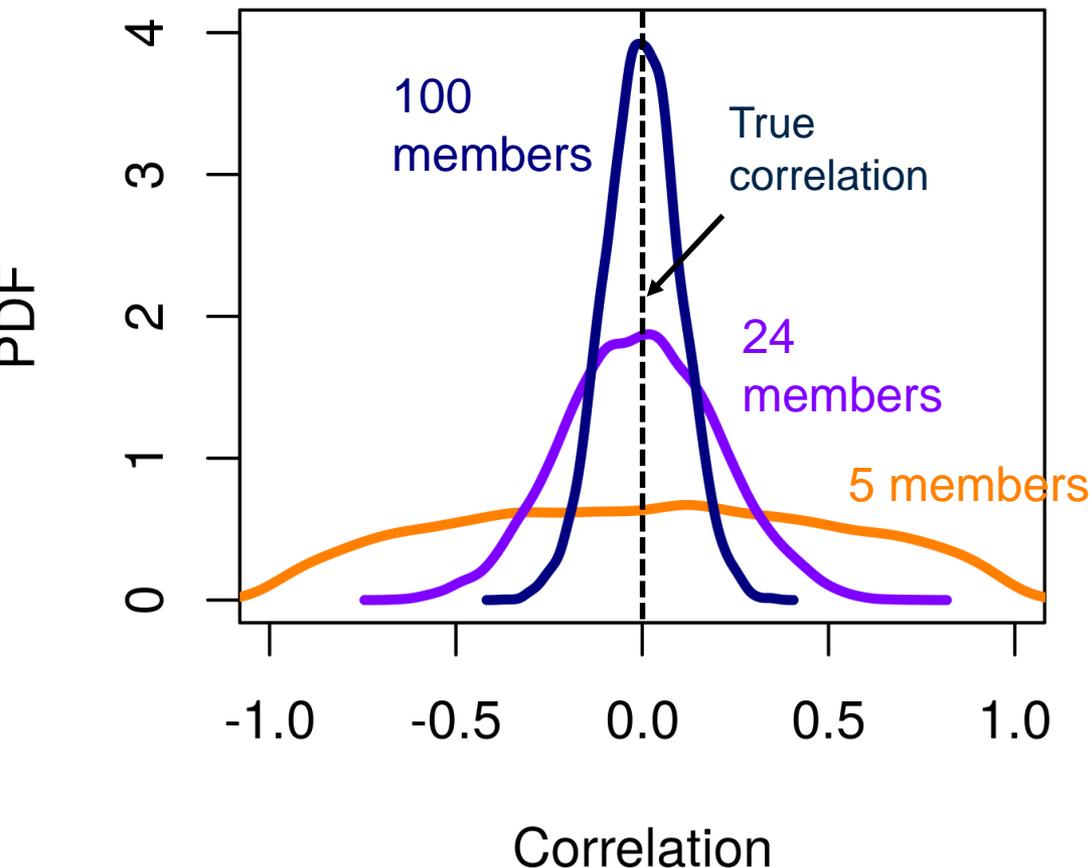

## Disk space:

- If you want to save everything
  - 24 members, save original (forecast) and updated (analysis) sea ice and ocean restarts + IFS + OASIS restarts: 5.5 Go per member, 132 Go per cycle.
  - This makes 55 To for a full period (35 yr, monthly cycles)
- If you want to save only the analyzed restarts (not forecasts), 40 To.
- If you want to save only the mean of all 24 restarts, this makes 1.7 To. **But then, an alternative perturbation strategy has to be proposed when starting predictions from the initial states produced by the EnKF**

# How much extra resources does the EnKF require?

- Do we really need 24 members? Can't we just run 5?

PDF of sample correlation between 2 variables with true correlation = 0.0

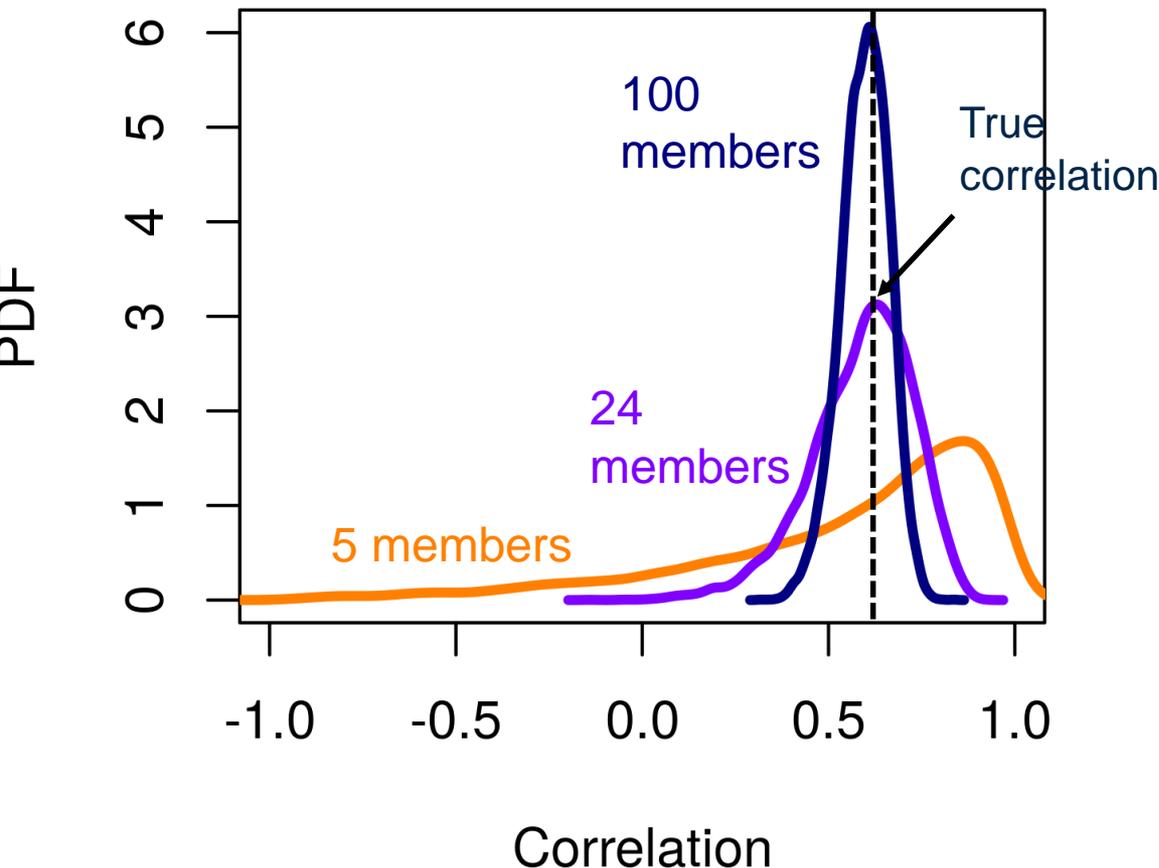

With 5 members, there are good chances to observe spurious correlations even though no physical link is actually present

# How much extra resources does the EnKF require?

- Do we really need 24 members? Can't we run just 5?

PDF of sample correlation between 2 variables with true correlation = 0.6

If a physical link exists (e.g. SSS-SIC), then with 5 members we will wrongly estimate the strength of the association, leading to either too strong or too weak updates.

# How much extra resources does the EnKF require?

- Can we call the EnKF routine less often than every month?

That's a test to do.

But the longest the assimilation window, the less constrained the initial state.

Also, the longest the assimilation window, the larger the spread, the larger the bias, and hence the larger the updates, the larger the risk to have restartability issues (because all updates are done in a linear space)

# What is the status of the EnKF in EC-Earth?

## Two configurations are currently working at BSC-ES

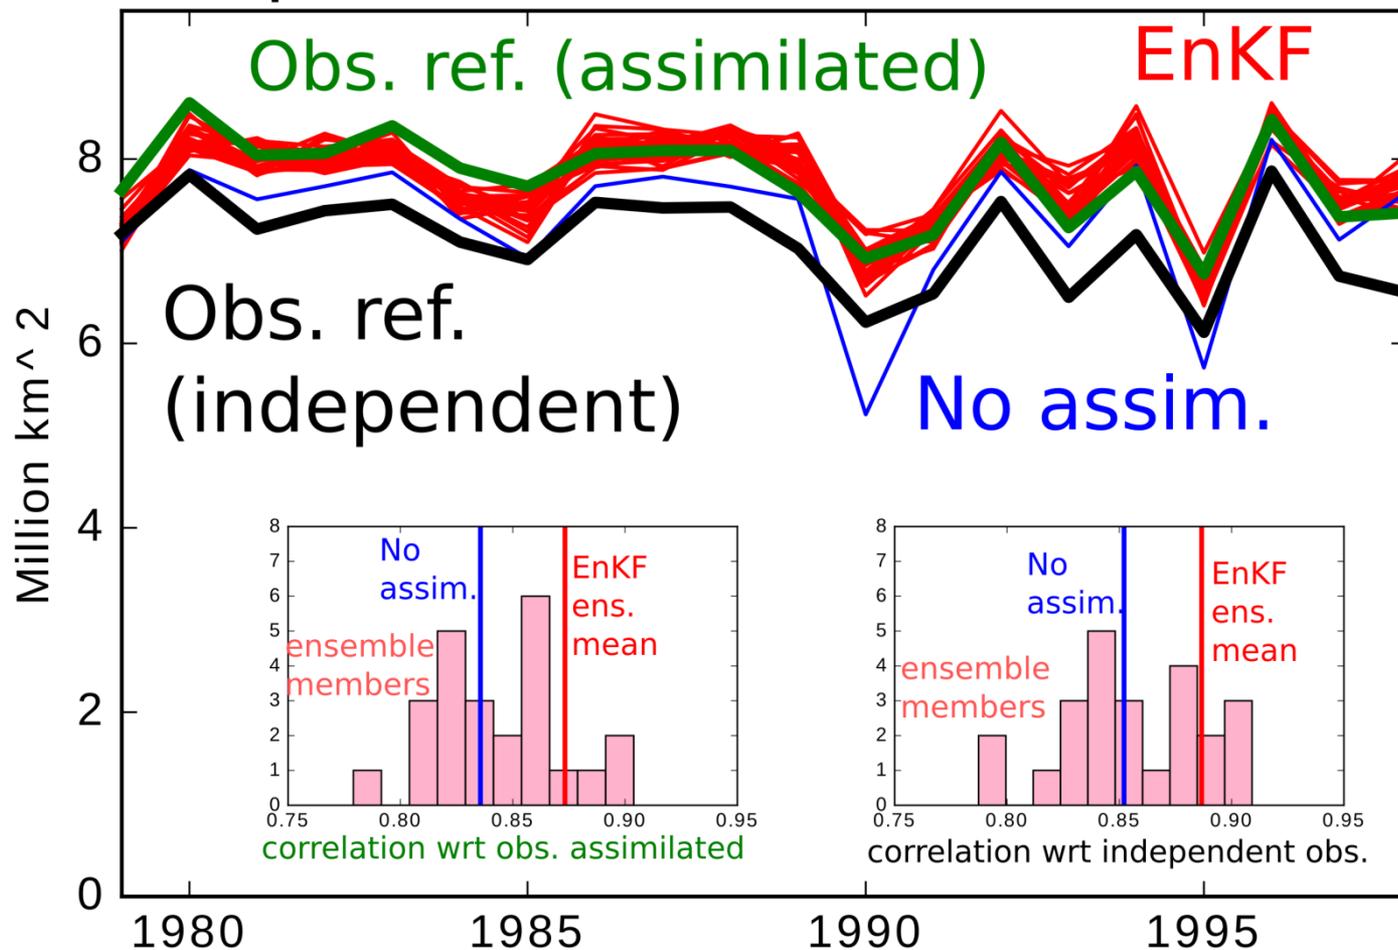

### – Stand-alone simulations

- NEMO3.6, forced by perturbed Drakkar Forcing Set 5.2
- 24 members
- 1979-1999 completed
- Assimilation of OSI-SAF SIC (1979-1993) and ESA-CCI SIC (1993-1999).
- Simulation is ongoing on MareNostrum3

### – Coupled simulations

- EC-Earth3.2
- 24 members
- 1993-1994 completed
- Assimilation of ESA-CCI SIC (1993-1999)
- Simulation is ongoing on MareNostrum3

## September Arctic sea ice extent

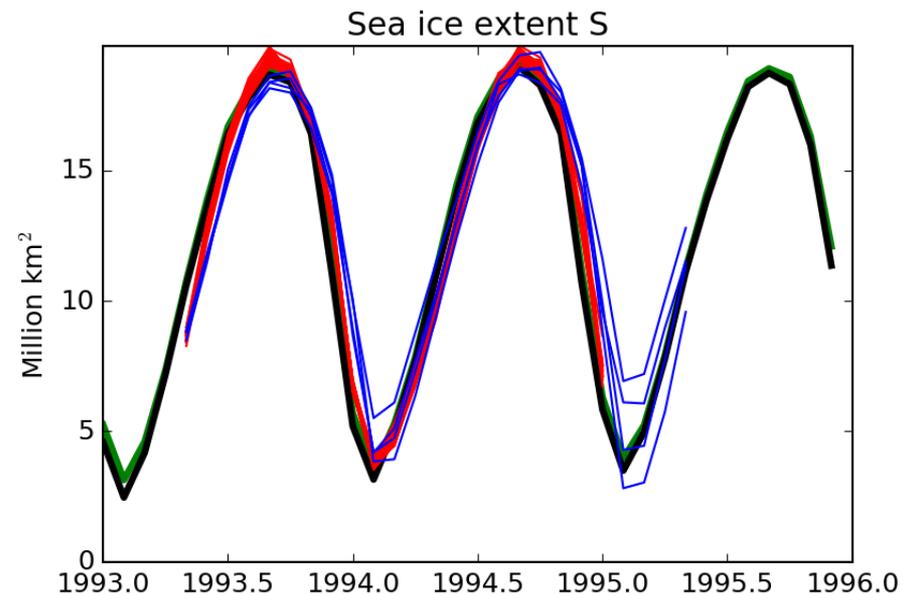

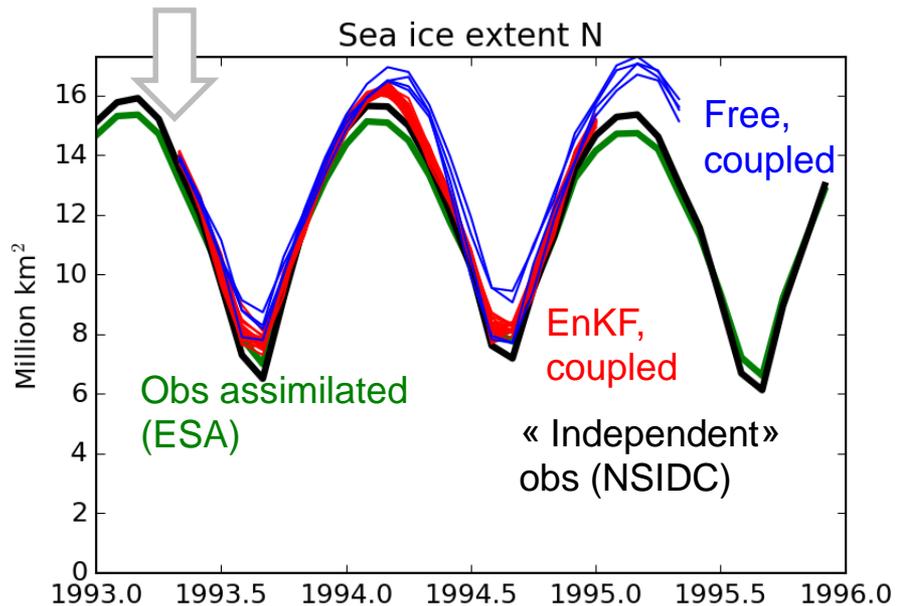

# Results from coupled experiments

The EnKF is able to keep EC-Earth track the observed sea ice extent despite systematic biases in the model

Start from IC  
obtained in EnKF  
forced reanalysis

The model is over confident in winter in Arctic, we may try to assimilate less often to increase the magnitude of the updates

# What are the plans of the EnKF in EC-Earth?

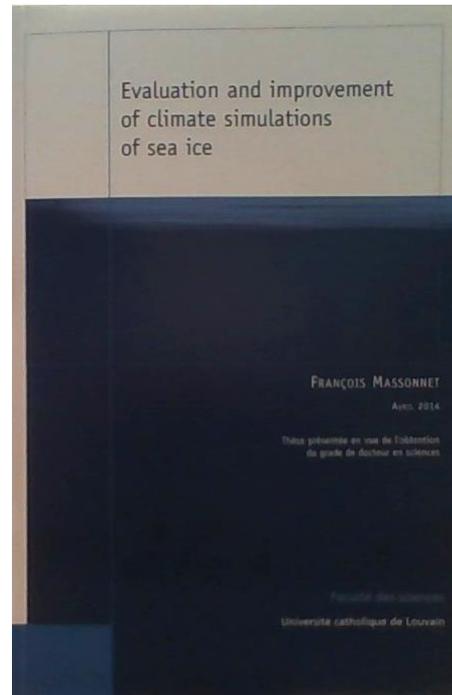

- (short-term) The ongoing stand-alone and coupled reanalyses will be extended to cover a full 1979-now period
- (short-term) The ongoing stand-alone reanalysis will be the base for DCPD
- (short-term) An assessment of the quality of the reanalysis will be done
- (mid-term): launch **ORCA025 stand-alone** EnKF
- (long-term): change EnKF code to also update atmosphere
- (long-term): launch **ORCA025 coupled** EnKF
