Dust prediction models

Sara Basart (sara.basart@bsc.es)

*Training Workshop on Sand and Dust Storms in
West Asia, La Laguna, Tenerife, Spain, 21 May 2018*

Questions will be welcome!

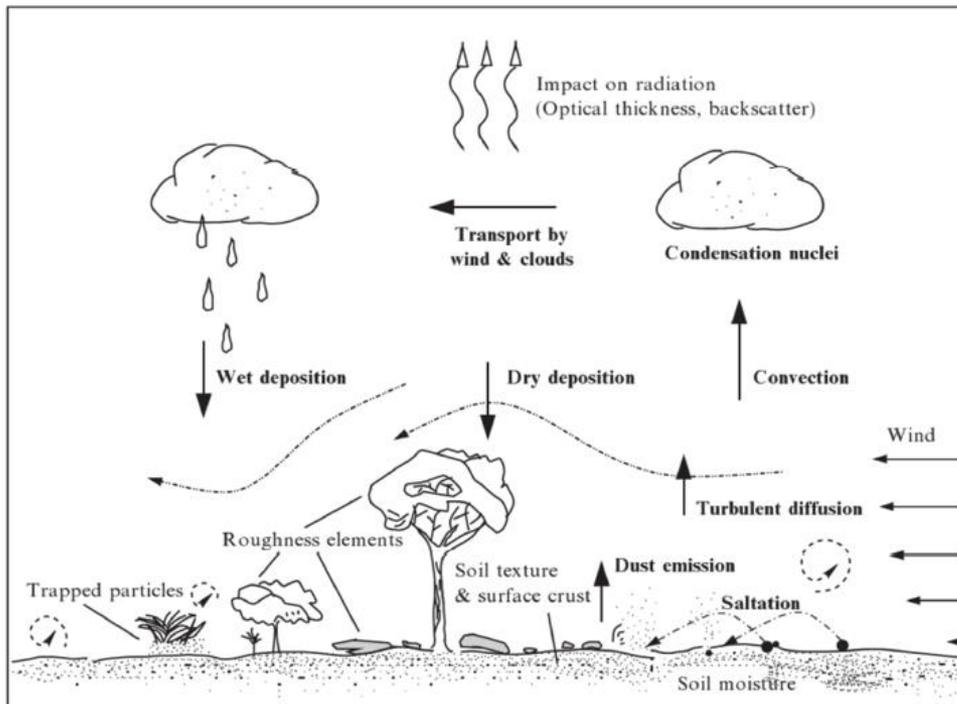

Introduction

What do we need to forecast dust storms?

1. Satellites, surface observations, NWP models and dust models.
2. Good knowledge of the dust climatology in the region.
3. Good knowledge of observation limitations.
4. Good knowledge of the dust model limitations.

Dust forecasting models

Dust models are a mathematical representation of atmospheric dust cycle.

Extracted from Shao (2008)

- ✓ To complement dust-related observations, filling the temporal and spatial gaps of the measurements.
- ✓ To help us to understand the dust processes and their interaction with climate and ecosystems.
- ✓ To predict the impact of dust on surface level concentrations used as **SHORT-TERM FORECASTING TOOLS** (3-5 days ahead)

Dust forecasting models

Dust forecasting models do **not** take account dust resuspension

Kathmandu, Nepal, March 2017

Outlook

1. Dust cycle and associated processes

- *The atmospheric dust cycle*
- *Dust global climatology*
- *Types of dust storms and model forecasting skills*

2. Dust forecasting models

- *Dust emission schemes and dust sources*
- *Dust transport*
- *Dust deposition and sedimentation*

3. Modeling the dust cycle at BSC: From R&D to operational

Dust cycle and associated processes

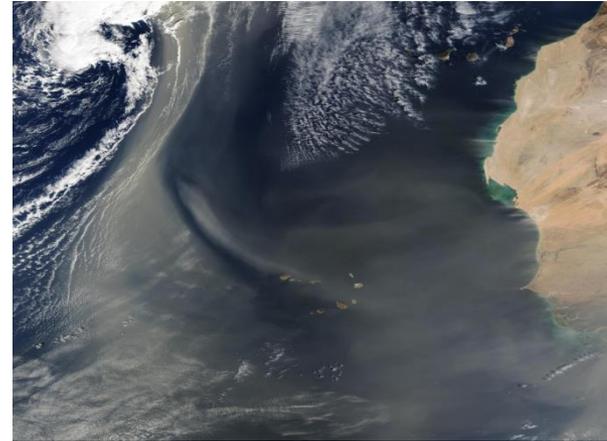

**Barcelona
Supercomputing
Center**

Dust cycle and associated processes

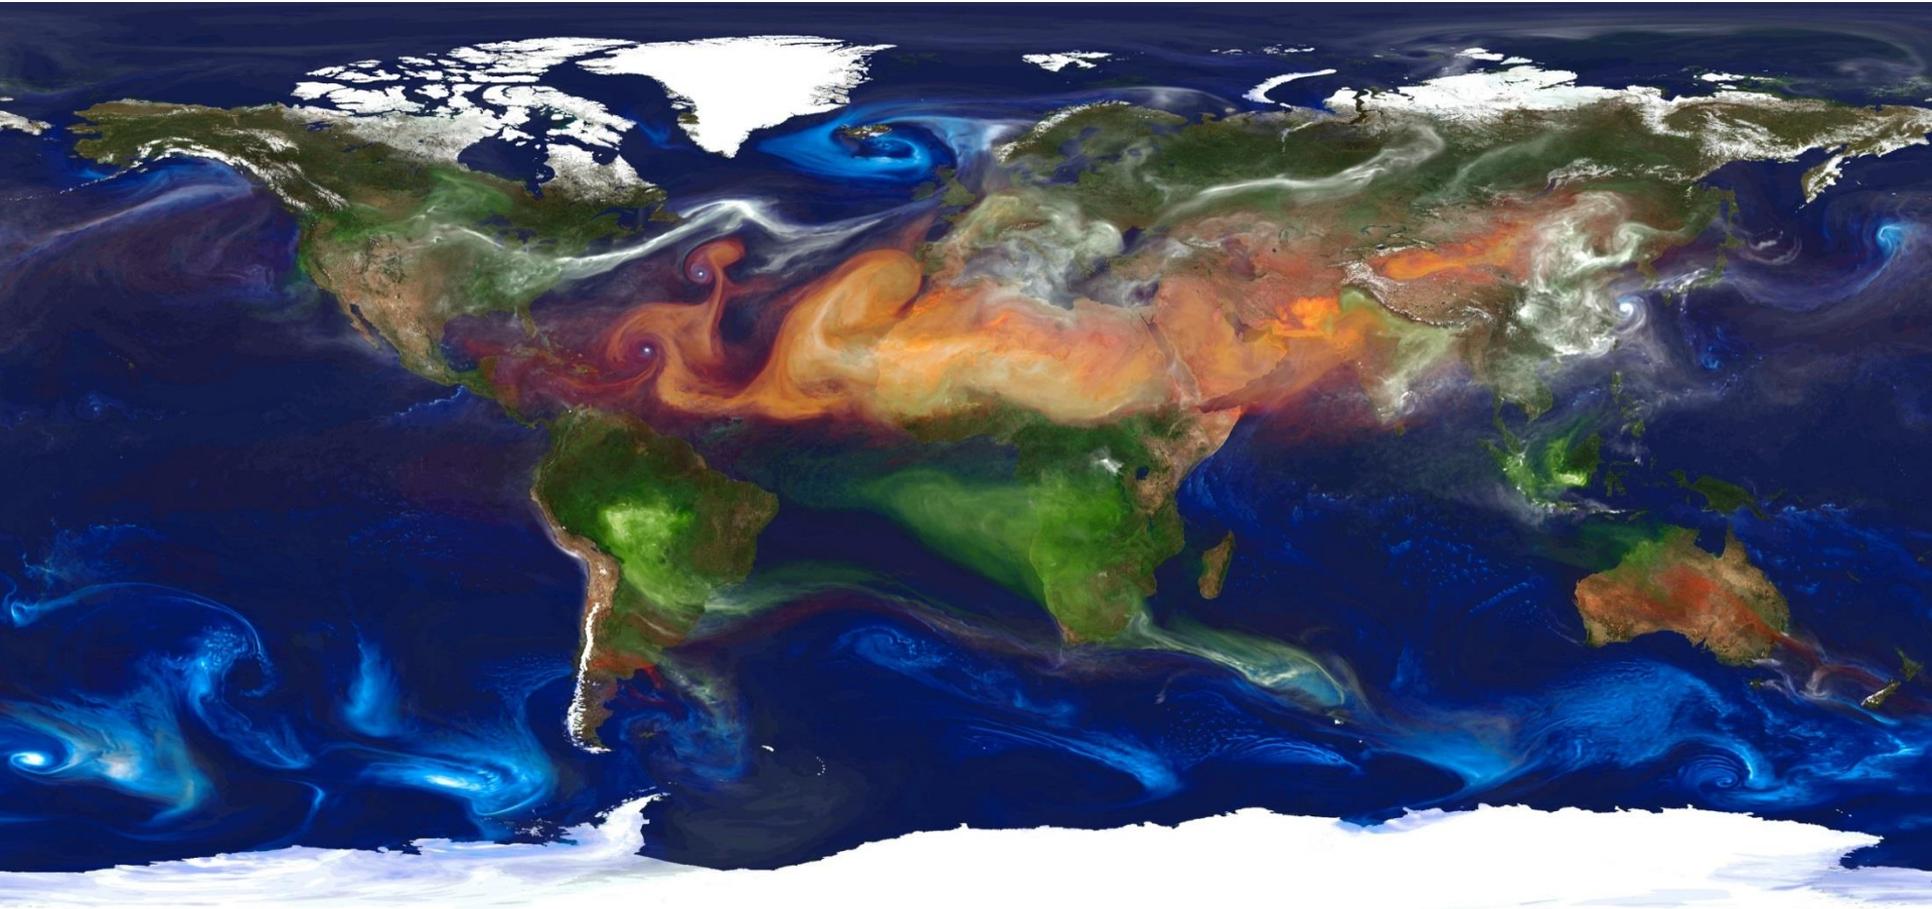

MODIS true colour composite image for March 2005 depicting a dust storm initiated at the Bodélé Depression (Chad Basin)

MODIS True color Western Africa – Atlantic Ocean

Dust transport is a global phenomenon. However, dust emission is a threshold phenomenon, sporadic and spatially heterogeneous, that is locally controlled on small spatial and temporal scales.

Dust cycle and associated processes

Organic Carbon + Elemental carbon

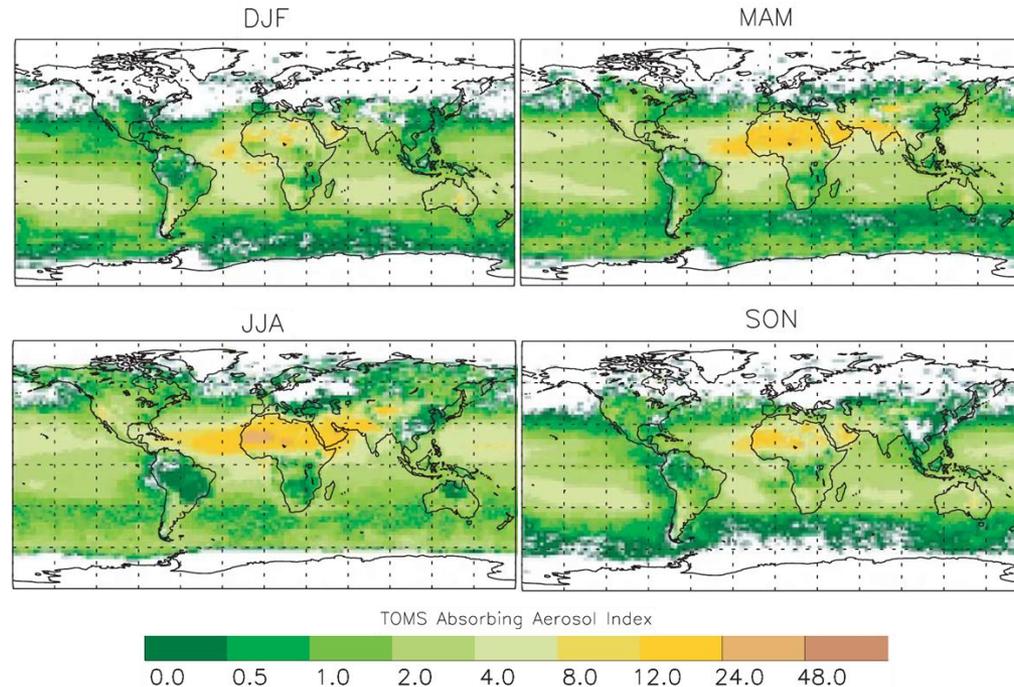

Dust

Sulfate

Sea salt

Dust cycle and associated processes

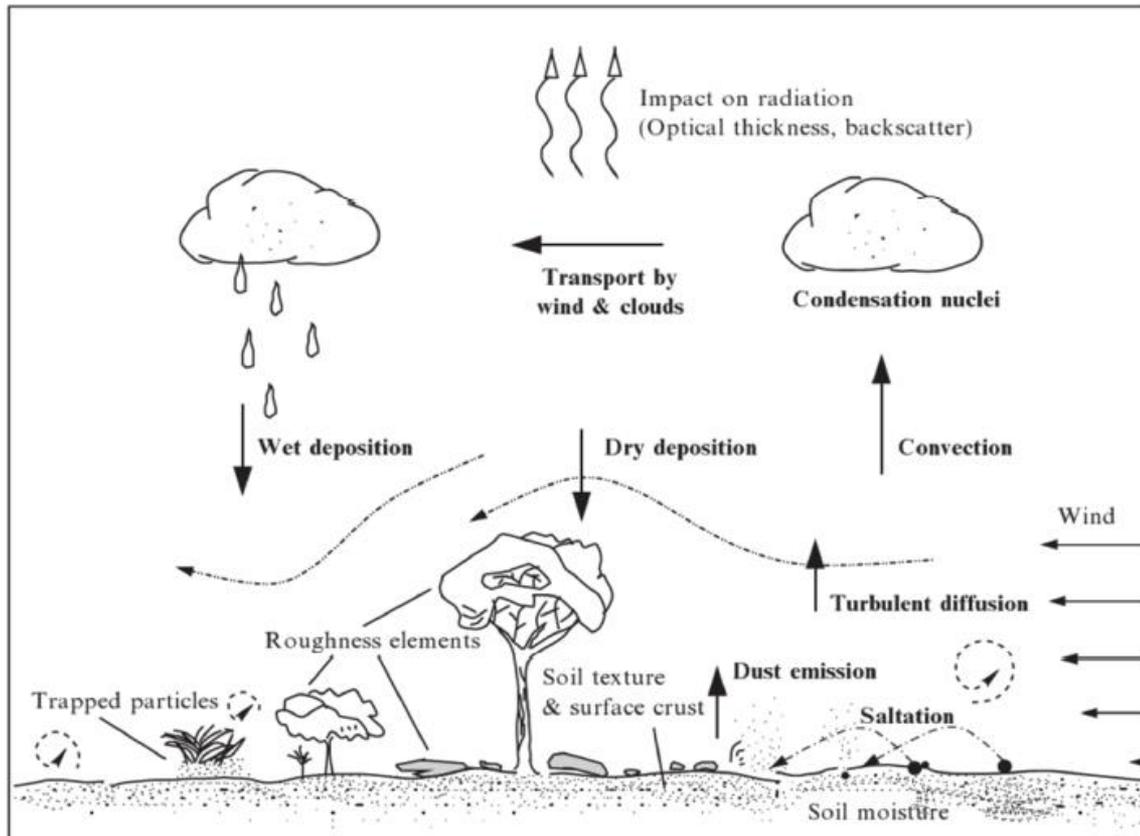

Temporal changes in the dust distribution: SEASONAL and DECADAL CHANGES

- Seasonal dust distribution changes well characterized. Follows seasonal changing weather regimes (mainly) and vegetation changes (in semi-arid areas)
- Interannual/decadal changes are controlled by climate and surface modification (land use, desertification). Decadal changes are not well captures by models

Dust cycle and associated processes

The atmospheric dust cycle and involves a variety of processes:

Extracted from Shao (2008)

- Dust emission from dry unvegetable surfaces (dust sources)
- Mid- and long-range transport
- Sedimentation, wet and dry deposition

Dust cycle and associated processes

Dust Impacts

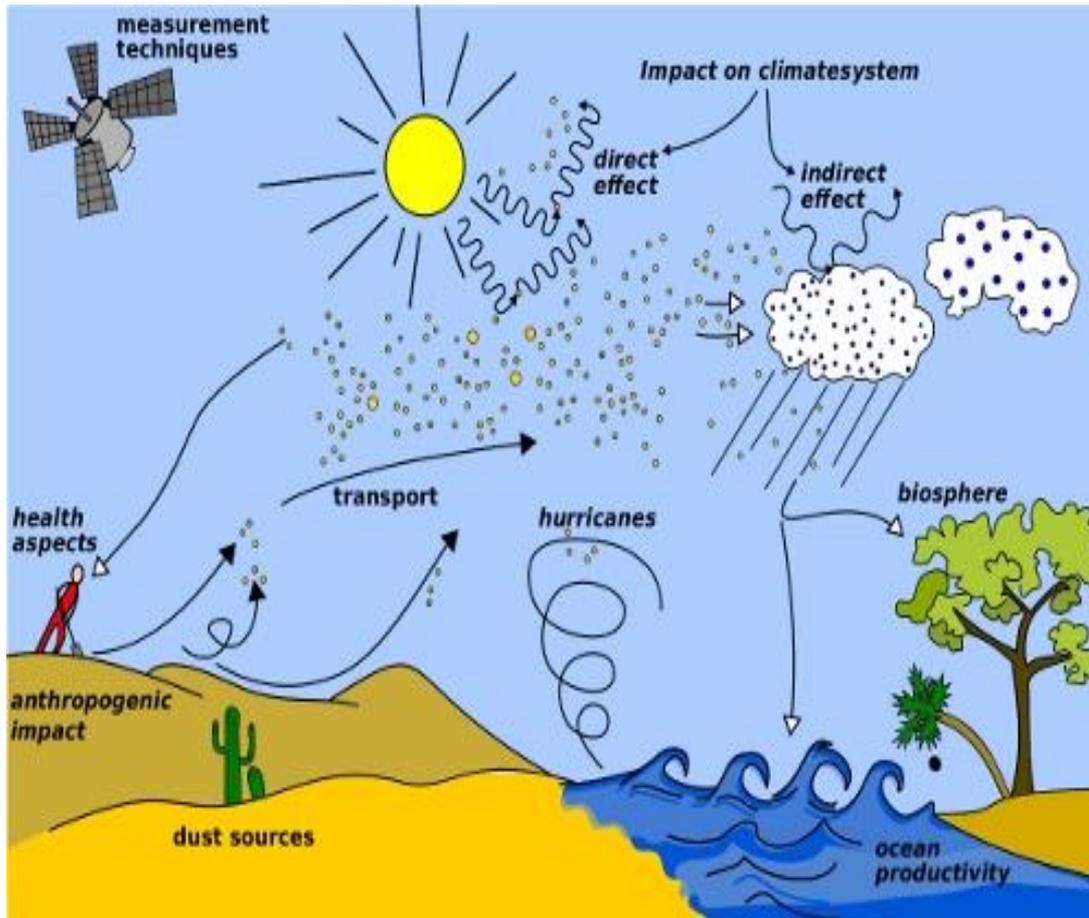

Image from WMO website
(<http://www.wmo.int/pages/prog/arep/wwrp/new/hurricanes.html>)

Ecosystems, meteorology and climate

- *Marine productivity*
- *Coral mortality*
- *Hurricanes formation*

Air Quality and Human Health

- *Respiratory disease (asthma)*
- *Eye infections*
- *Meningitis in Africa*
- *Valley Fever in the Americas*

Aviation and Ground Transportation

- *Low visibility (i.e. air disasters)*

Agriculture and fishing

Energy and industry

Dust cycle and associated processes

Types of dust storms:

Synoptic dust storms (large scale weather systems)

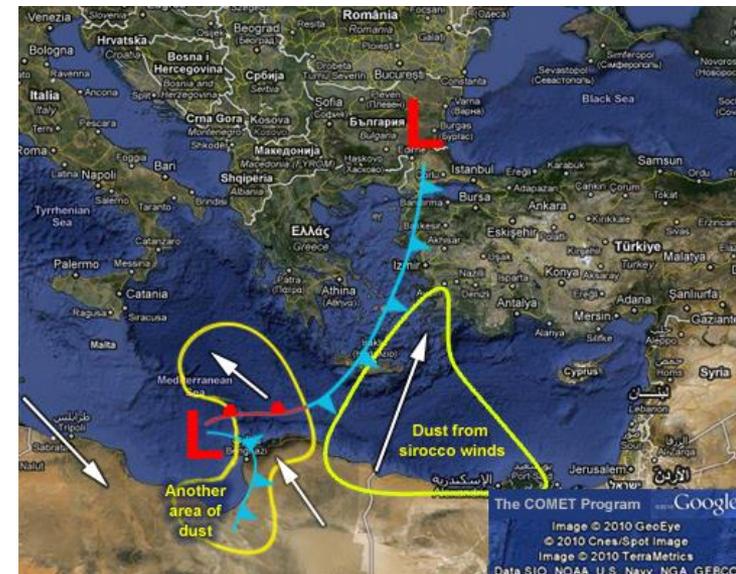

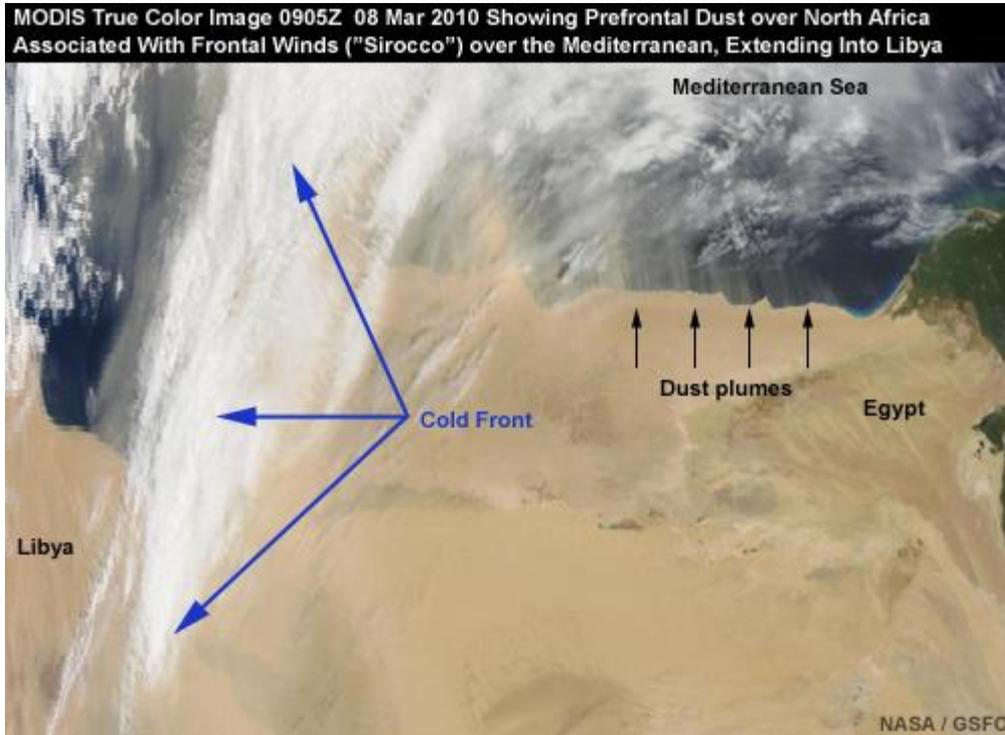

- Prefrontal winds
- Postfrontal winds
- Large-scale Trade winds
- ...

Mesoscale dust storms

- Downslope winds
- Gap flow
- Convection (dust devils and Haboobs)
- Inversion downburst storms
- ...

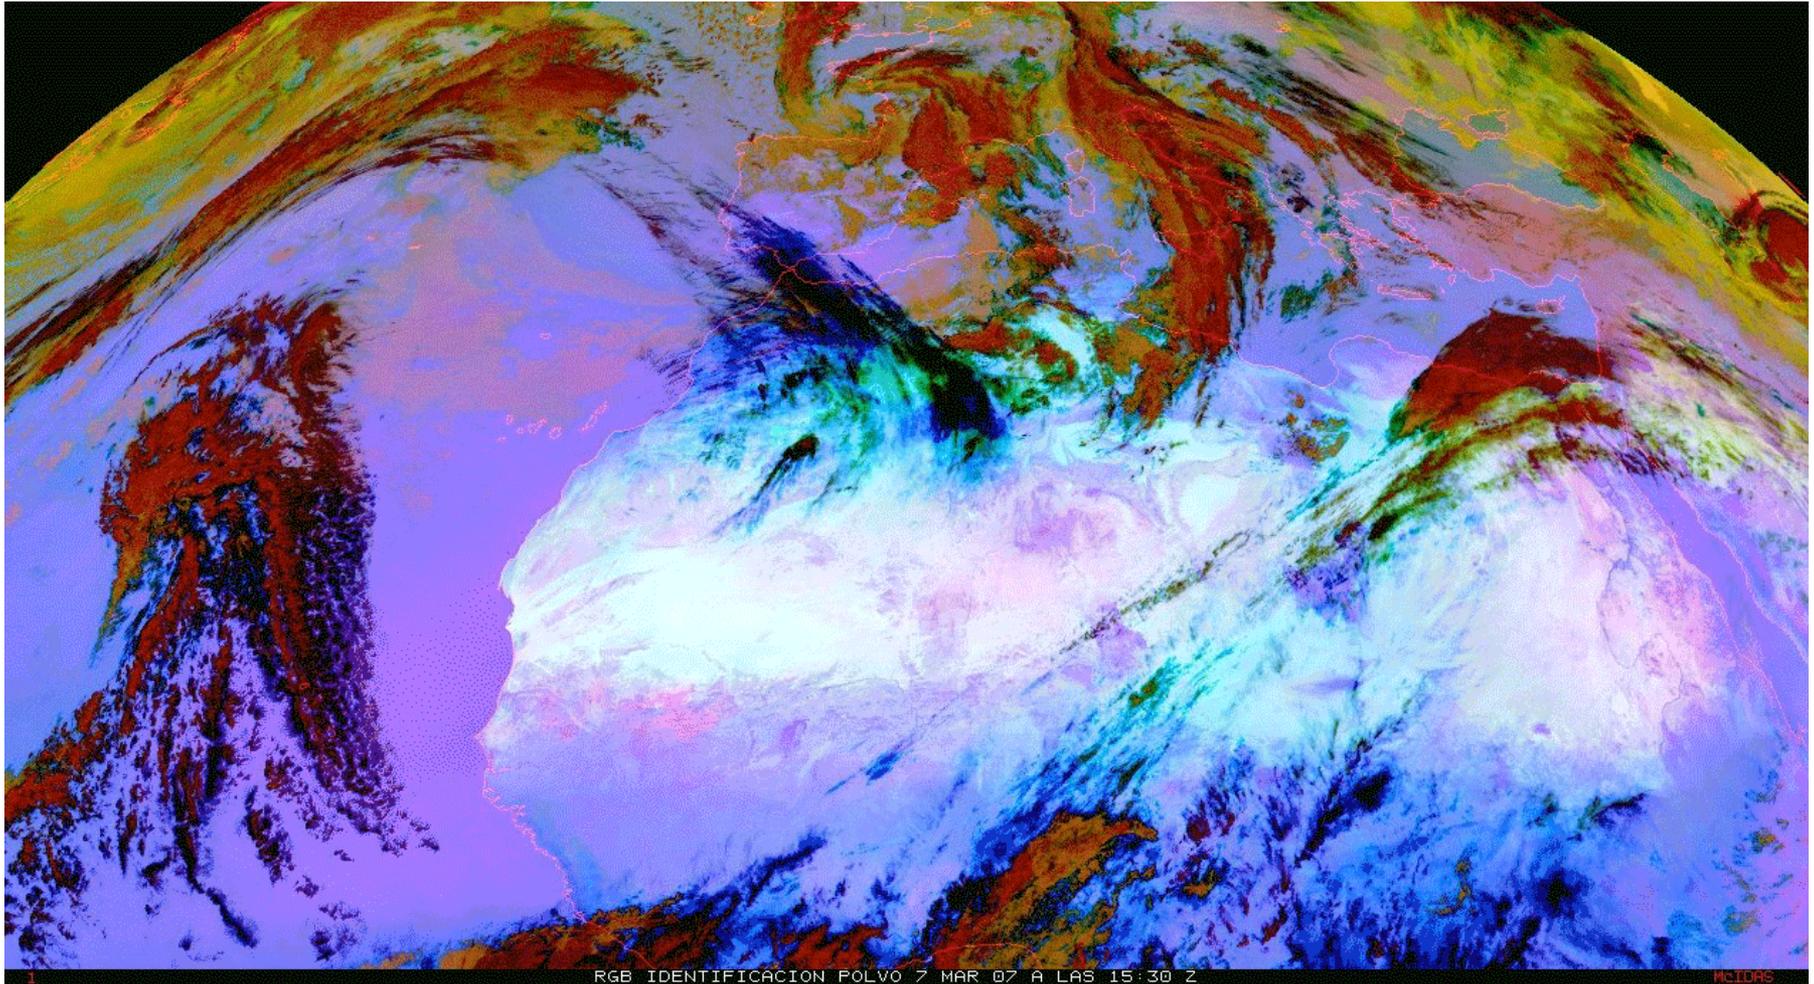

Dust cycle and associated processes

Synoptic dust storms: Pre-frontal

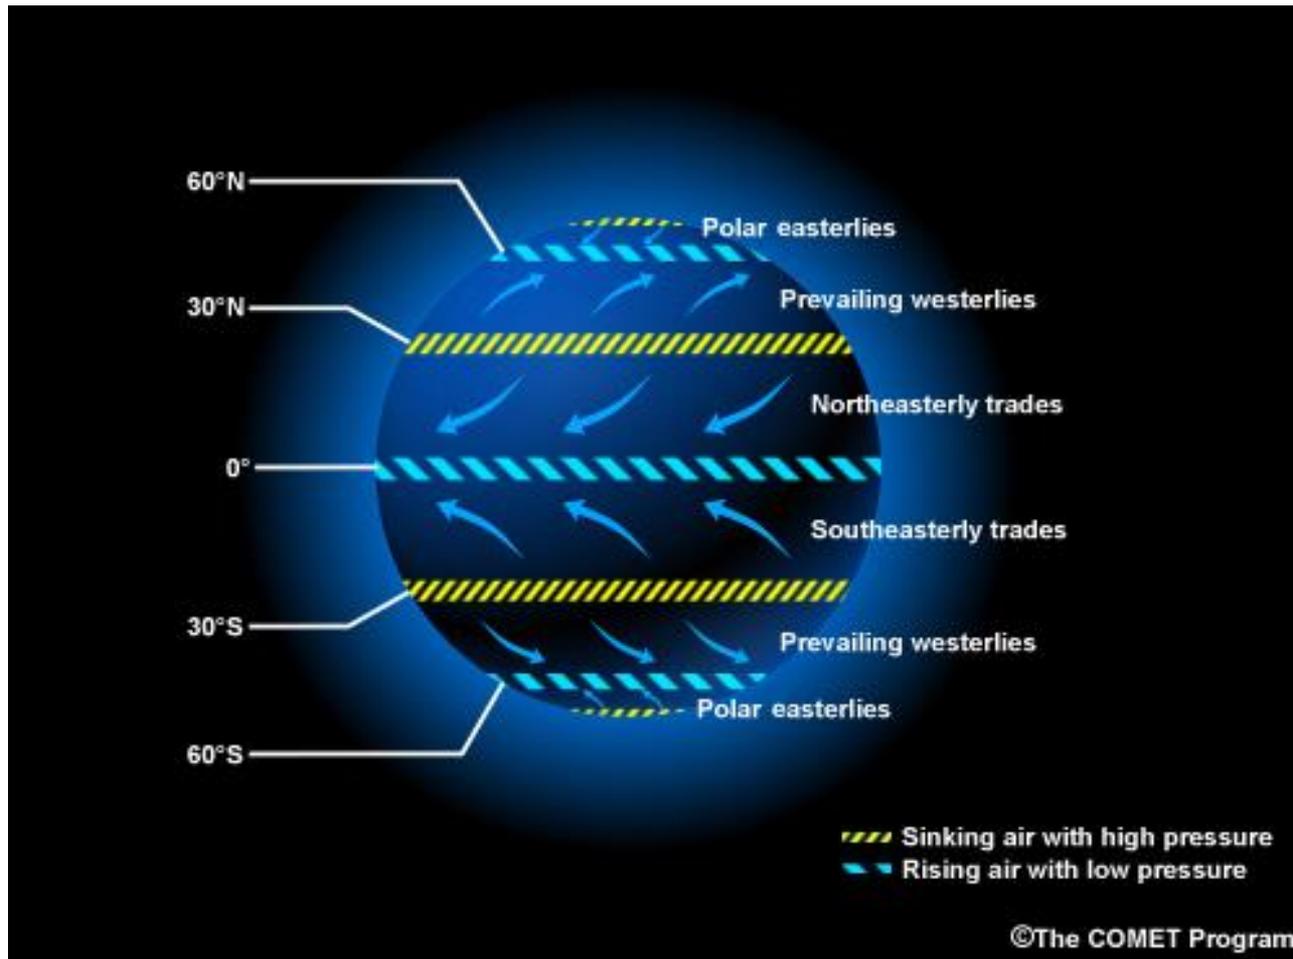

Dust cycle and associated processes

Synoptic dust storms: Post-frontal

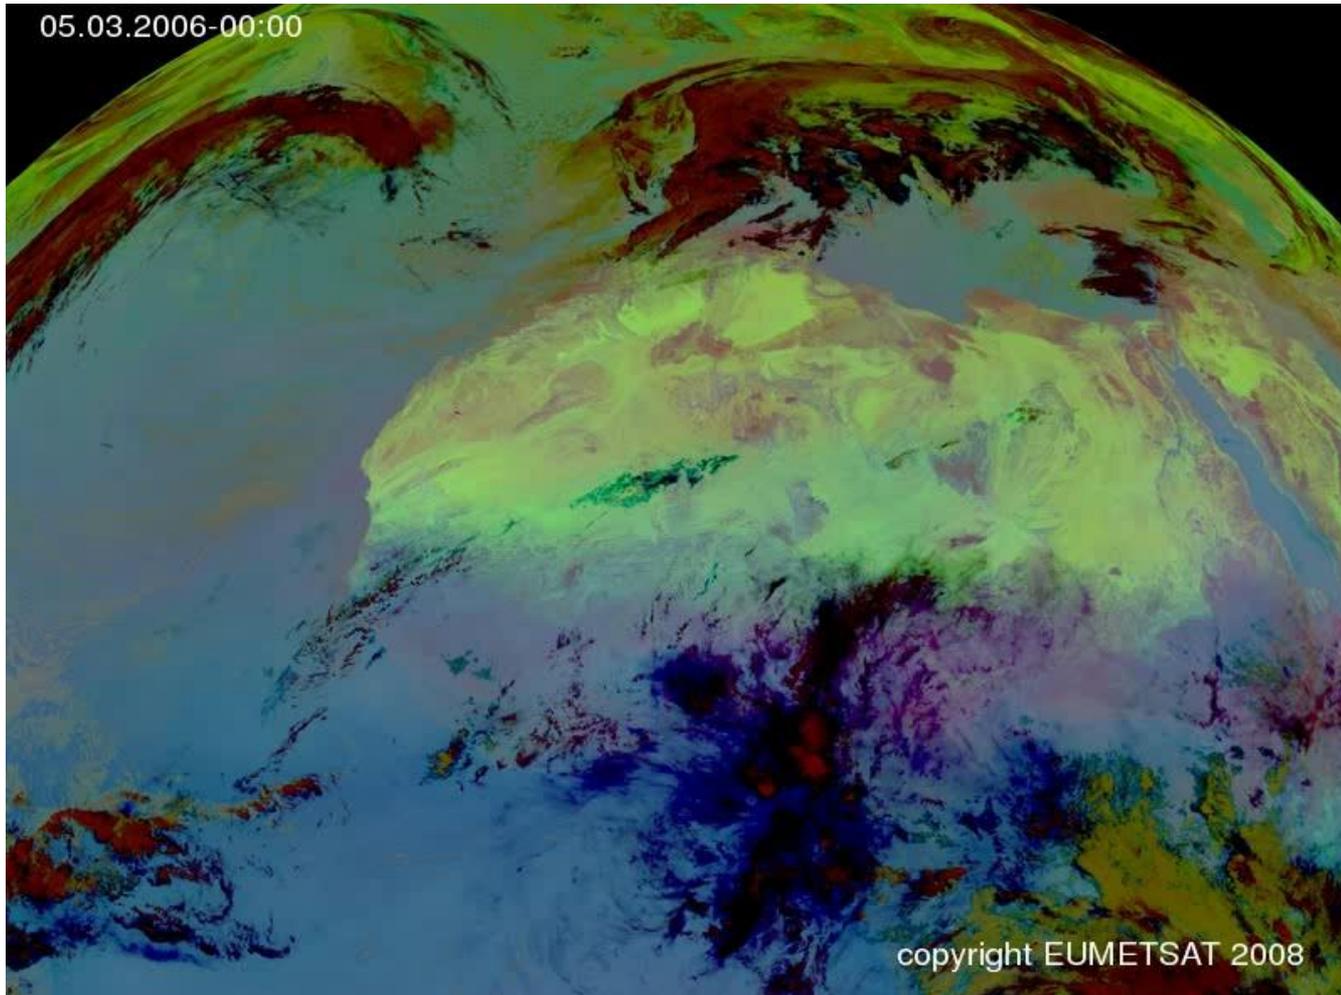

Dust cycle and associated processes

Synoptic dust storms: Large-scale trade winds

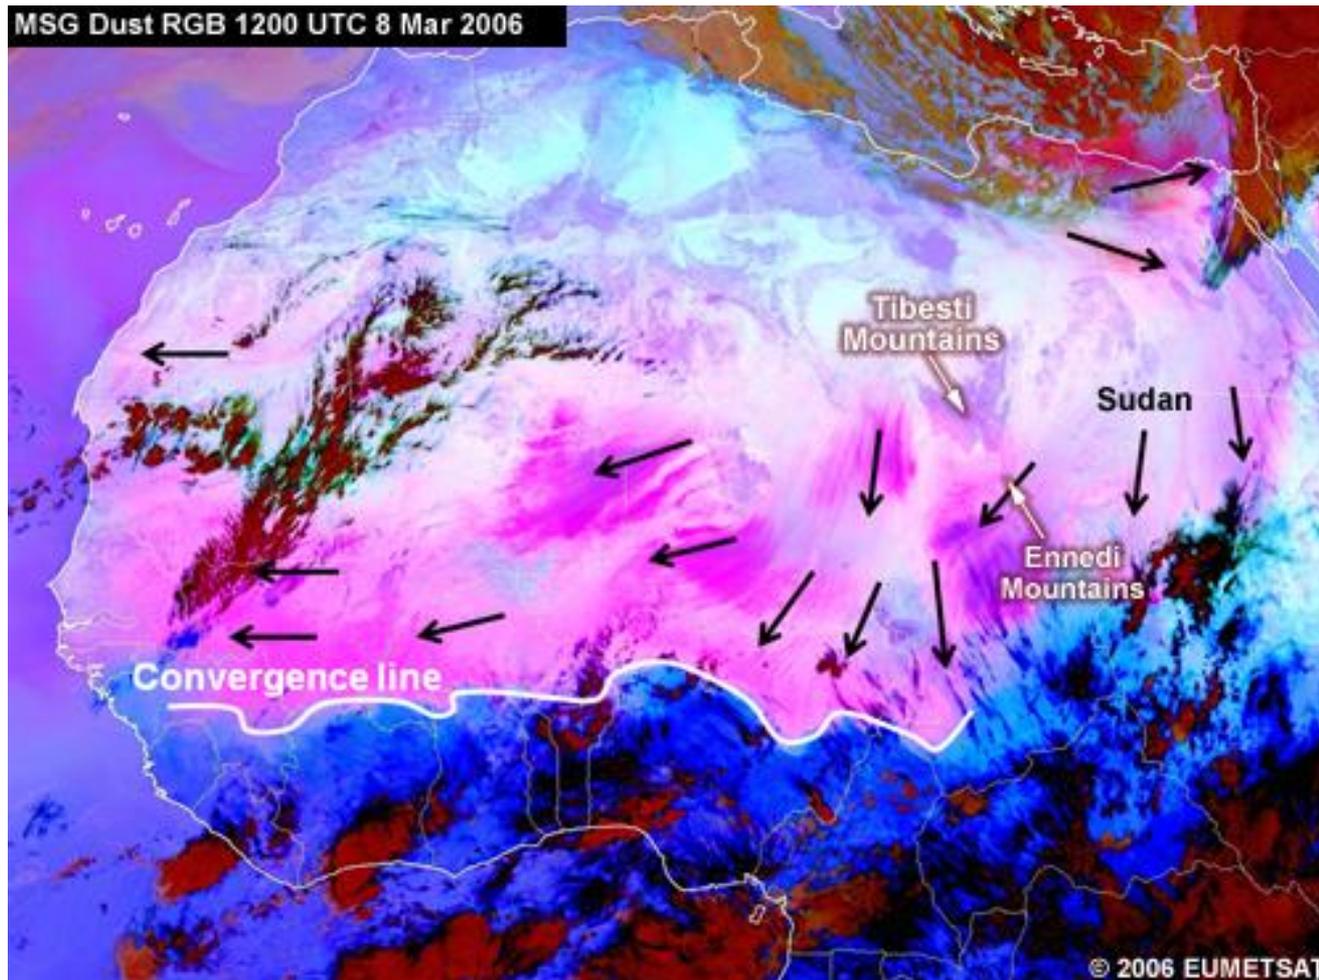

Dust cycle and associated processes

Synoptic dust storms: Large-scale trade winds

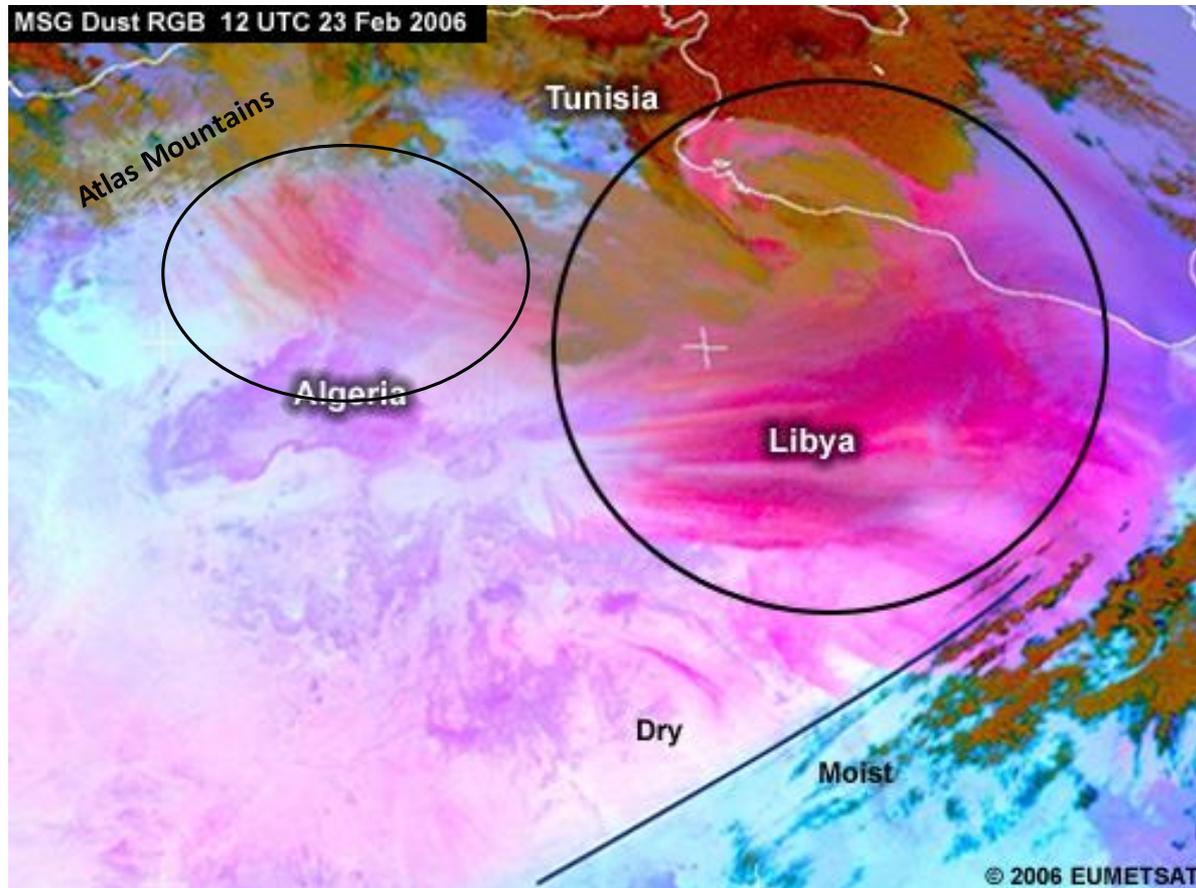

Dust cycle and associated processes

Synoptic dust storms: Large-scale trade winds

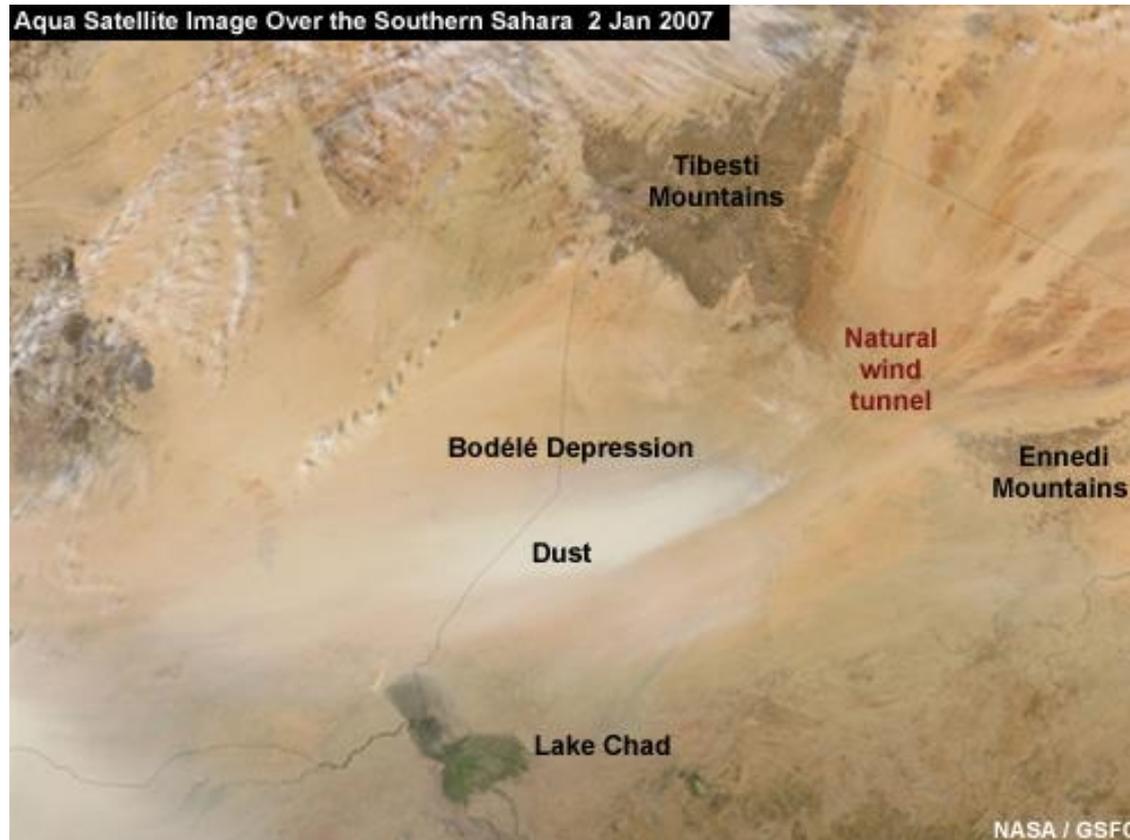

Dust cycle and associated processes

Mesoscale dust storms: Downslope winds

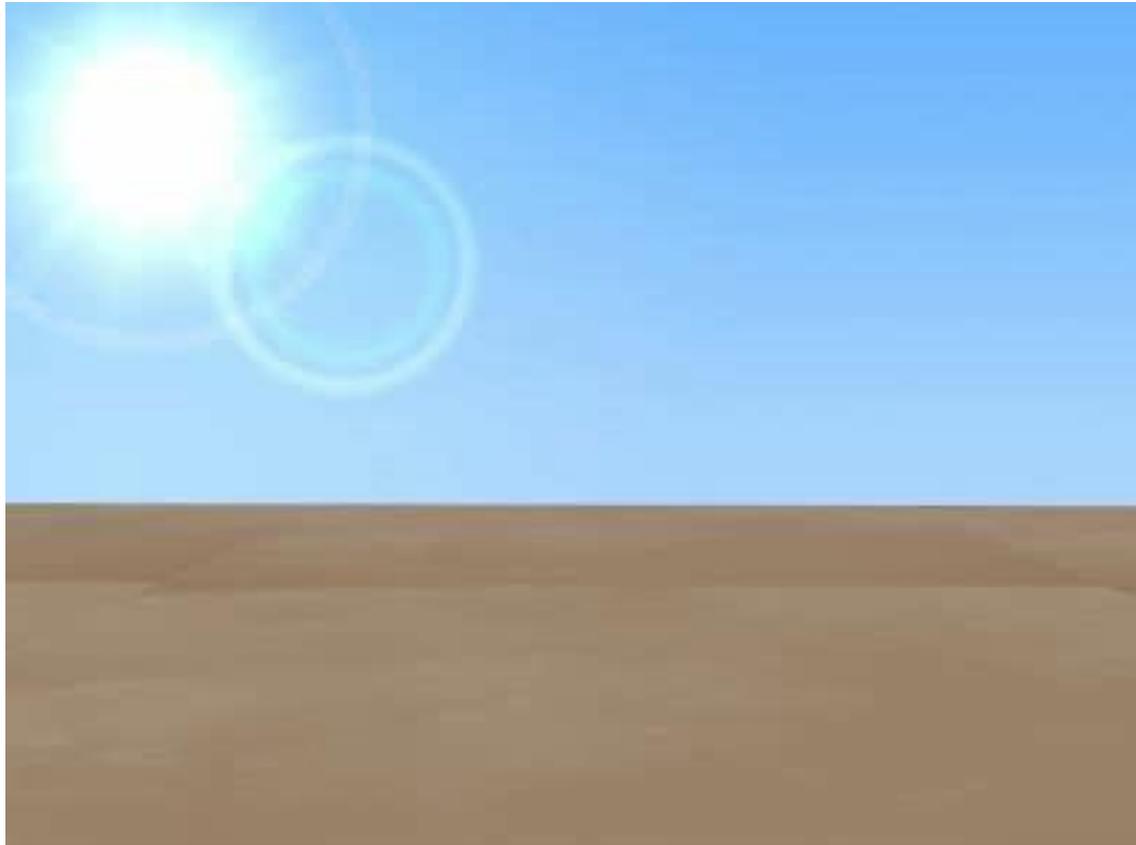

Dust cycle and associated processes

Mesoscale dust storms: Gap flow

Dust cycle and associated processes

Mesoscale dust storms: Dust devils (convection)

Dust cycle and associated processes

Mesoscale dust storms: Haboobs

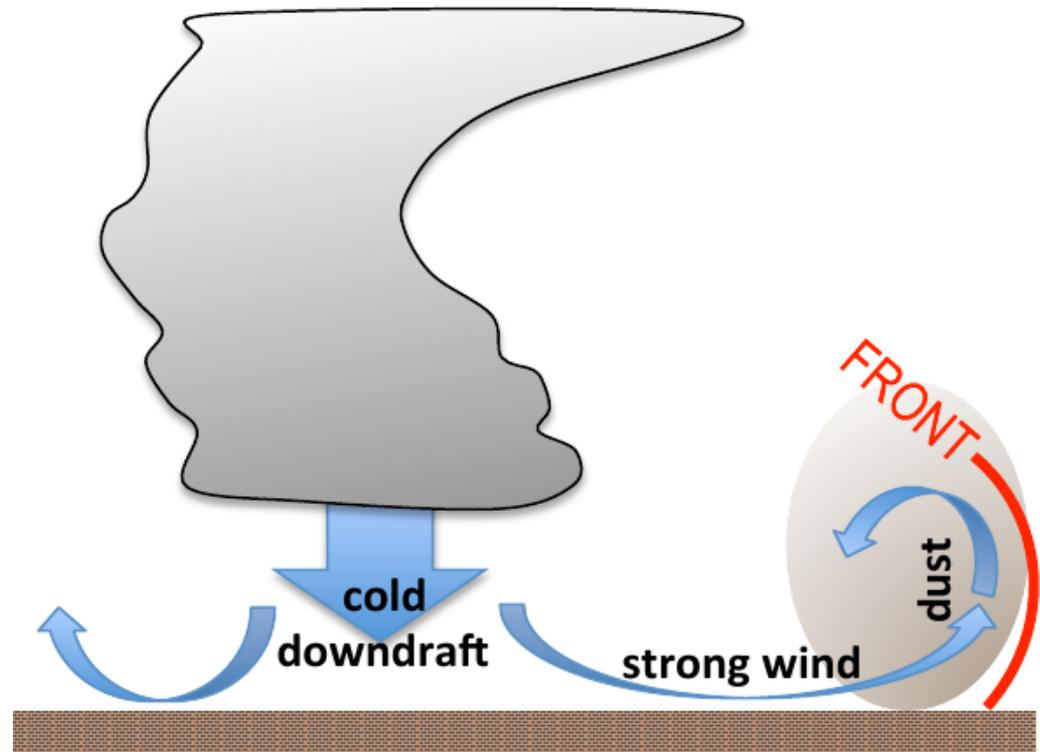

Movie from the COMET program at <http://meted.ucar.edu/> of the University Corporation for Atmospheric Research (UCAR)

Dust cycle and associated processes

Mesoscale dust storms: Haboobs

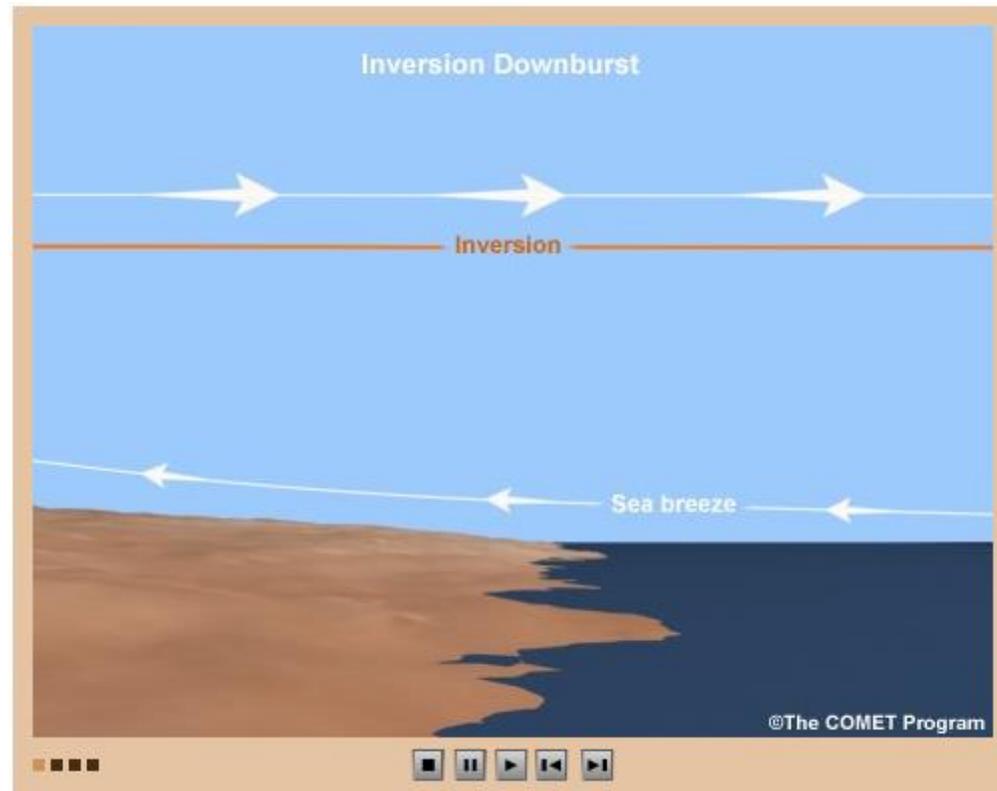

Intensive cold
downbursts from
convective cells
produced high velocity
surface wind, creating
cold front which was
lifting, mixing and
pushing dust

Expected: high wind speed, drop in temperature, rise in humidity, rise in pressure, reduction of visibility.

Dust cycle and associated processes

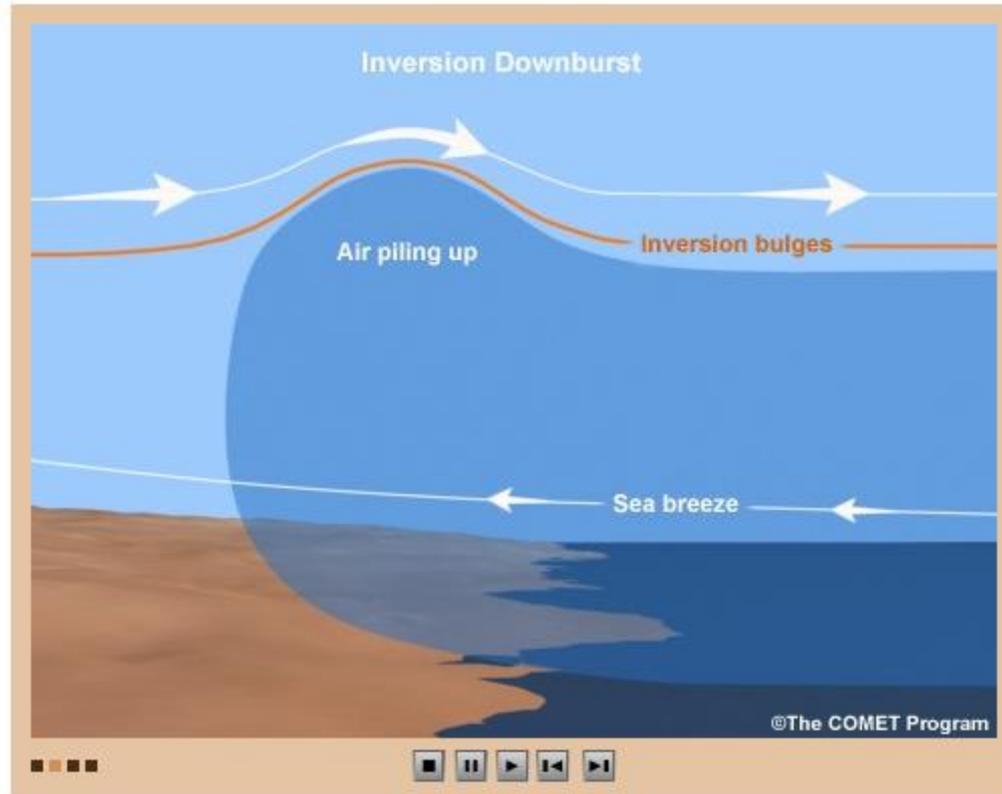

Mesoscale dust storms: Inversion downbursts

Movie from the COMET program at <http://meted.ucar.edu/> of the University Corporation for Atmospheric Research (UCAR)

Dust cycle and associated processes

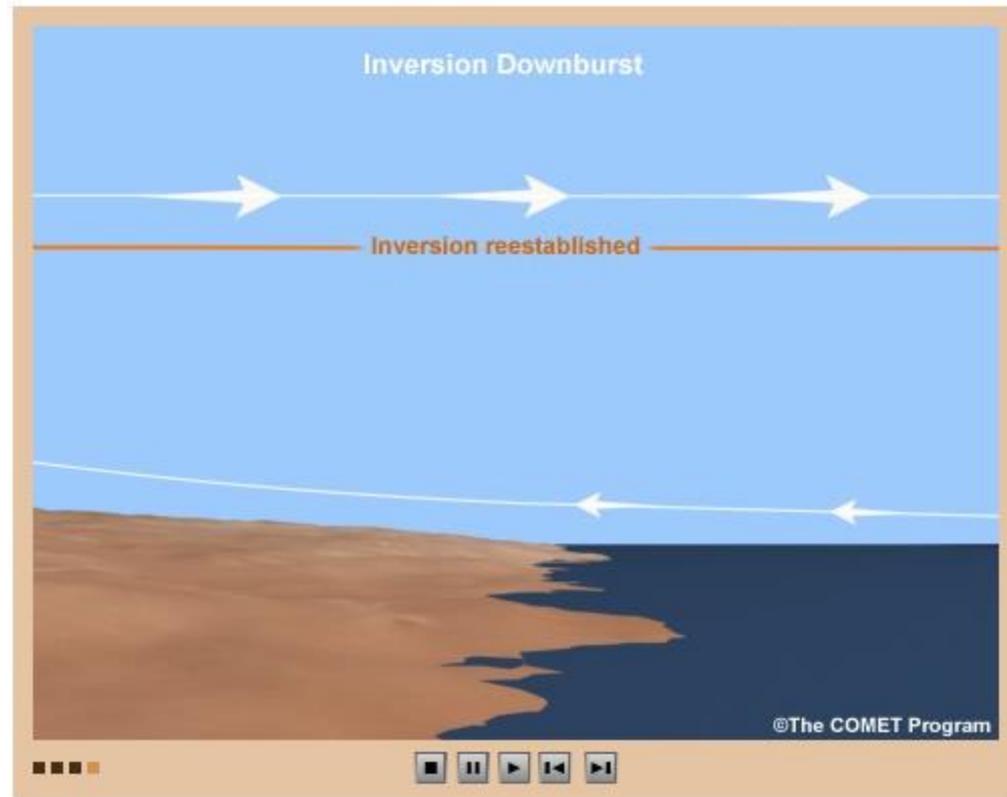

Mesoscale dust storms: Inversion downbursts

Dust forecasting models

Extracted from Guirado et al. (2014, ACP)

Dust forecasting models

- Dust processes span over five orders of magnitude in space and time. **Dust transport** is a global phenomenon. However, **dust emission** is a threshold phenomenon, sporadic and spatially heterogeneous, that is locally controlled on small spatial and temporal scales.
- To correctly describe and quantify the dust cycle, one needs to understand equally well local-scale processes such as saltation and entrainment of individual dust particles as well as large-scale phenomena such as mid- and long-range transport.

Accurate representation of dust sources and sinks is critical for providing realistic magnitudes and patterns of atmospheric dust fields.

Desert dust soil types

Main landscapes of the North Africa
(Photos from Callot et al. 2000) :

A) Central part of Saharan Atlas. In the background, mountains, and in front, an overgrazed plain;

B) Northern part of Saharan Atlas. Esparto grass steppe degraded by a strong anthropic action. The sandy soil disappears, denuding the sandstone substratum;

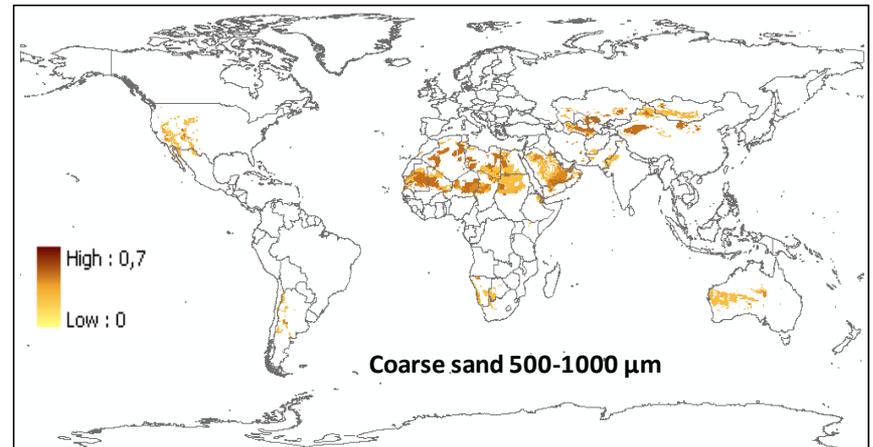

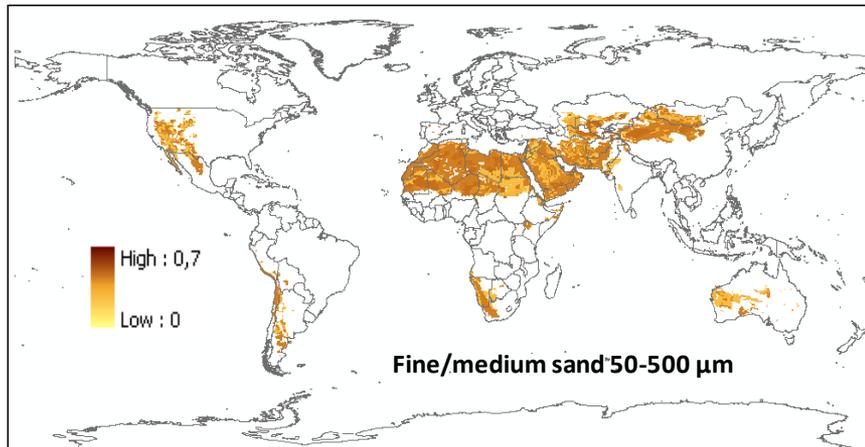

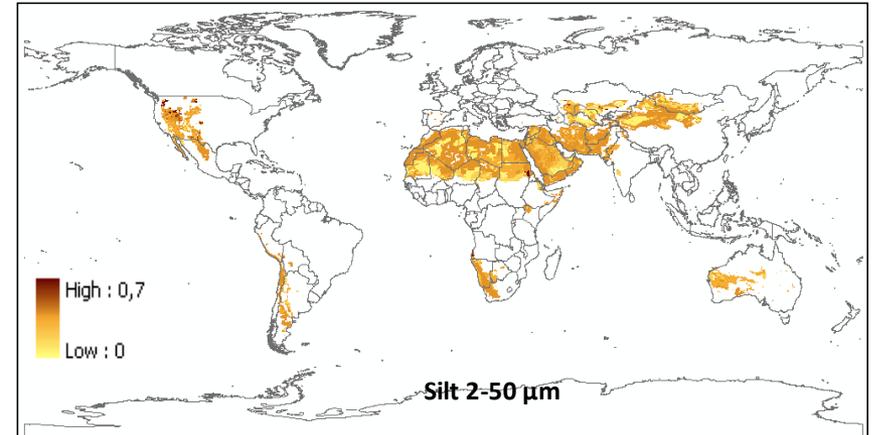

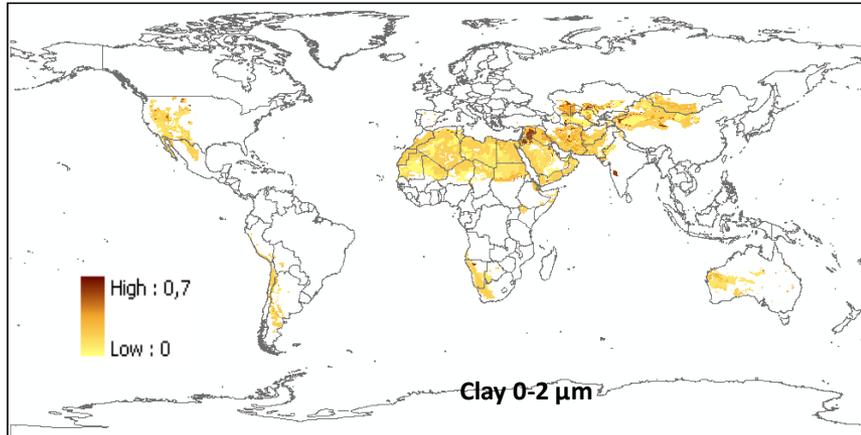

C) The Great Hamada south-west of El-Abiodh-Sidi-Cheikh;

D) Daïa in the Mechfar, at Hassi Cheikh well;

E) North-east of the Great Western Erg: coarse sand interdune corridor with deflation cauldron and palaeolake deposits;

F) North-east of the Great Western Erg: great coarse sand dome dunes, covered by fine sand active dunes.

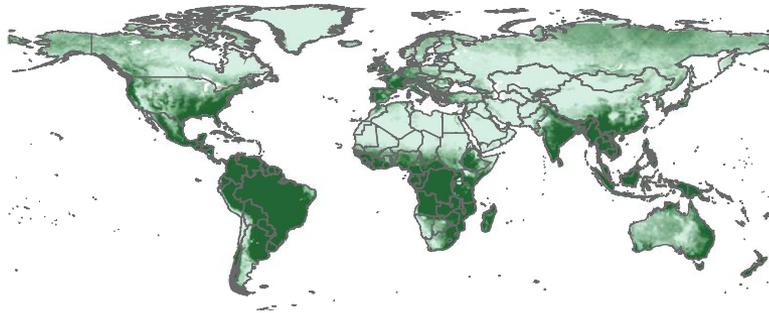

Soil size distribution derived from soil texture

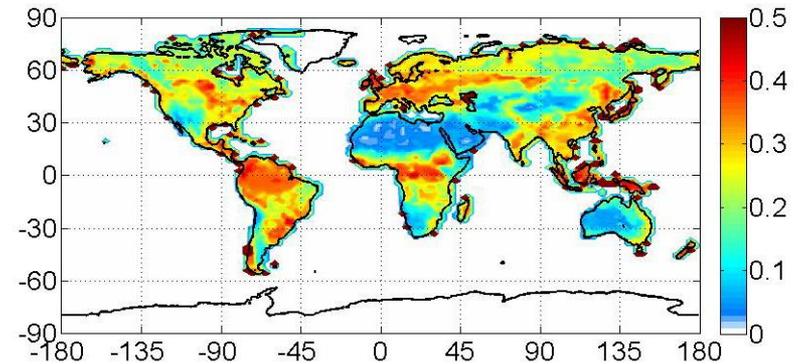

Four top soil texture classes according STASGO-FAO 1km database are converted to 4 parent soil size categories following Tegen et al. [2002].

Vegetation, roughness, soil moisture

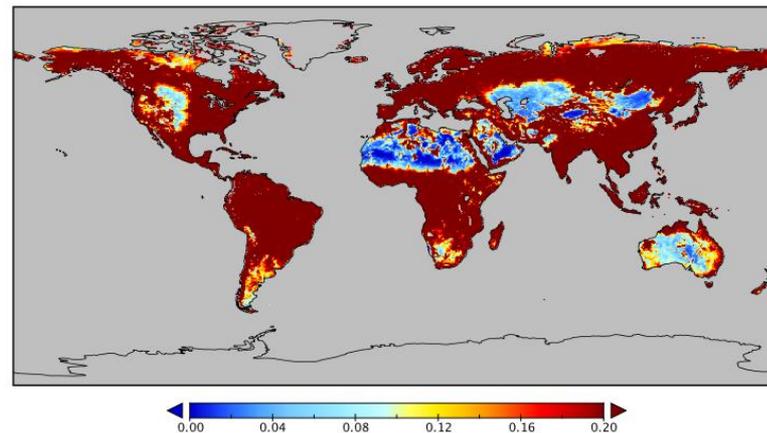

Vegetation fraction
(MODIS)

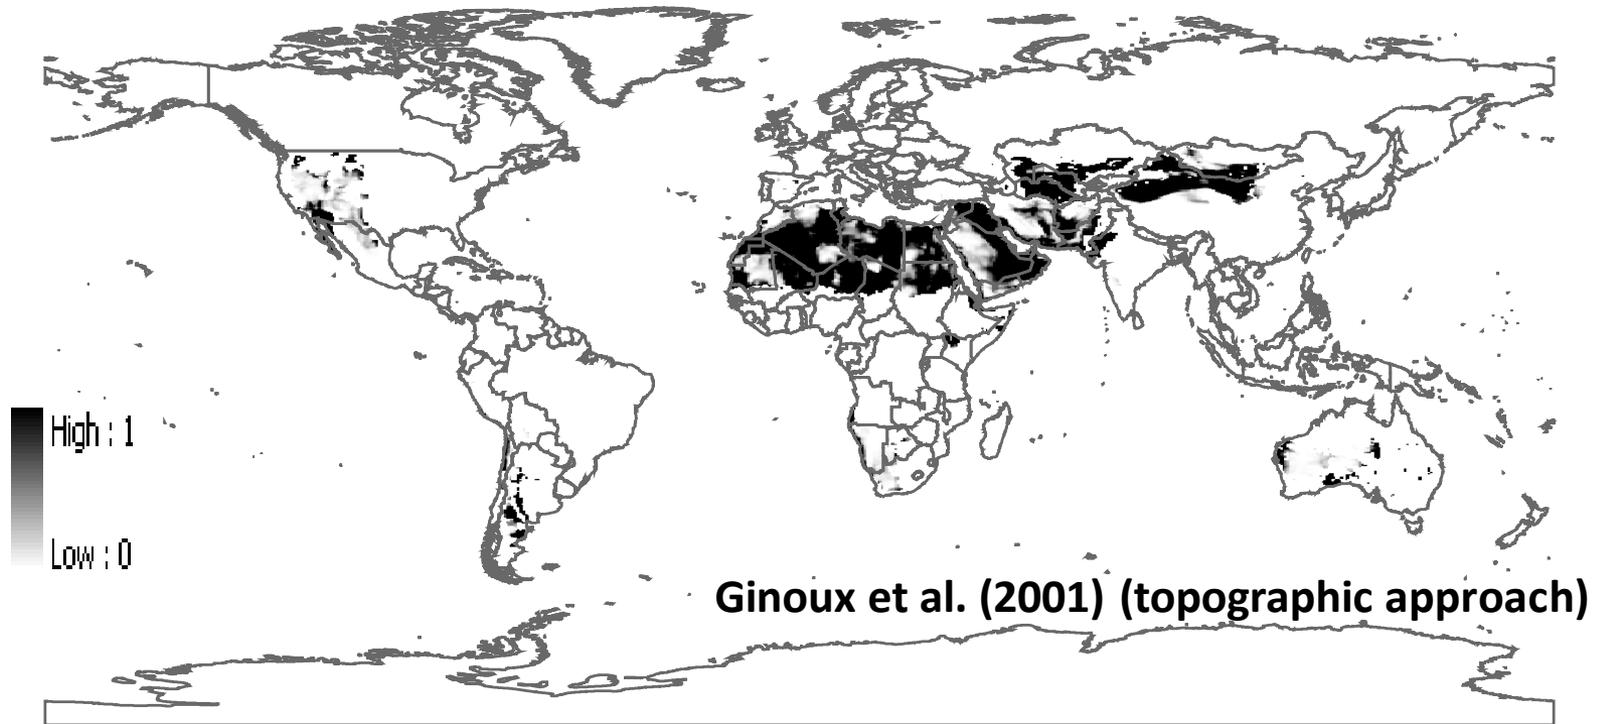

Soil moisture
(model based)

Roughness length
(ASCAT + PARASOL)

Source mapping: why?

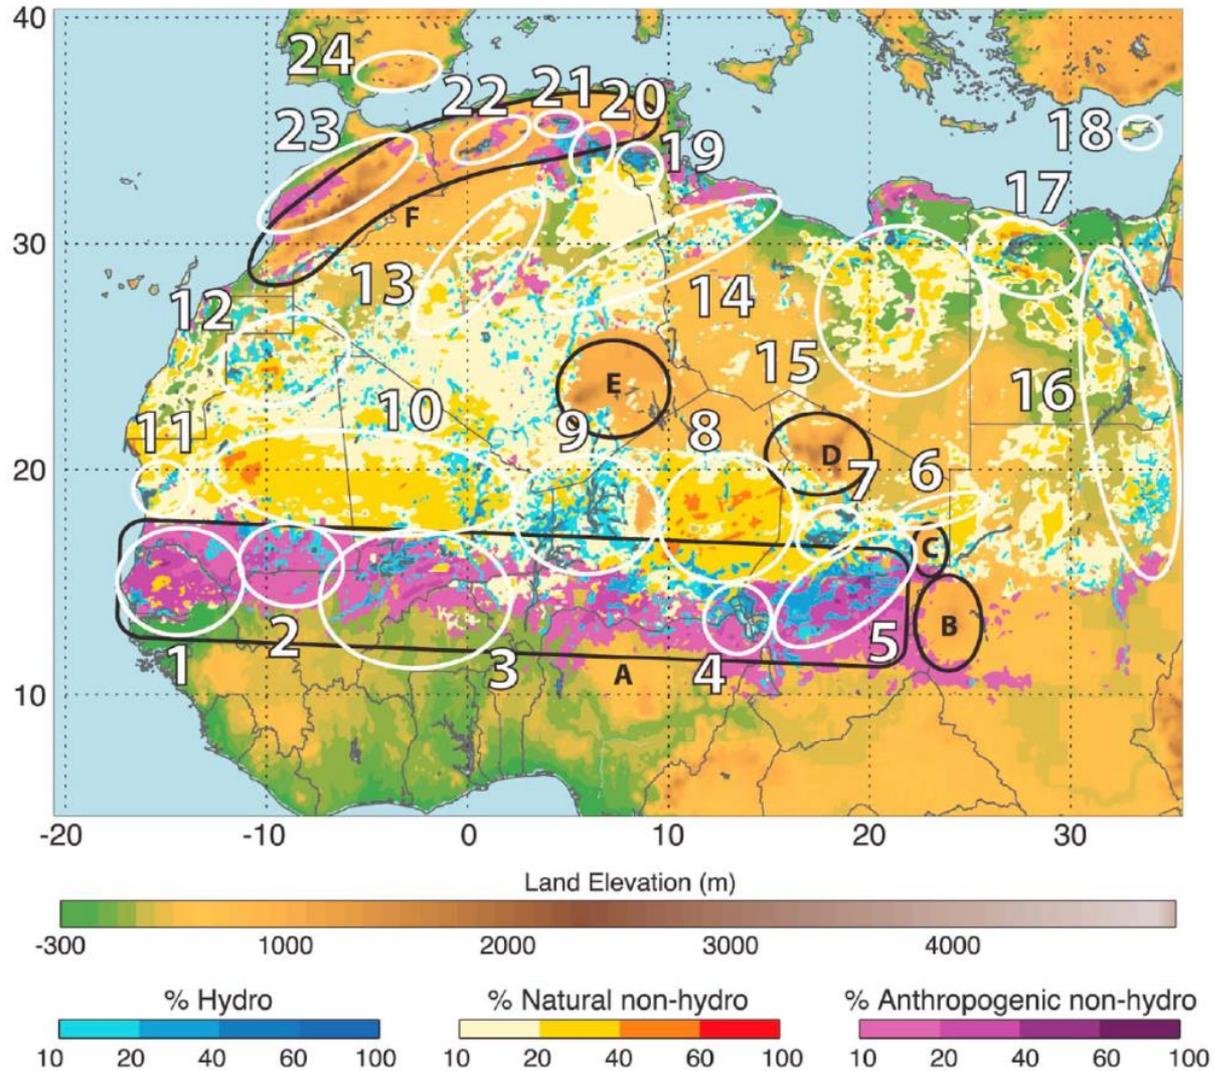

$$S = \left(\frac{z_{\max} - z_i}{z_{\max} - z_{\min}} \right)^5$$

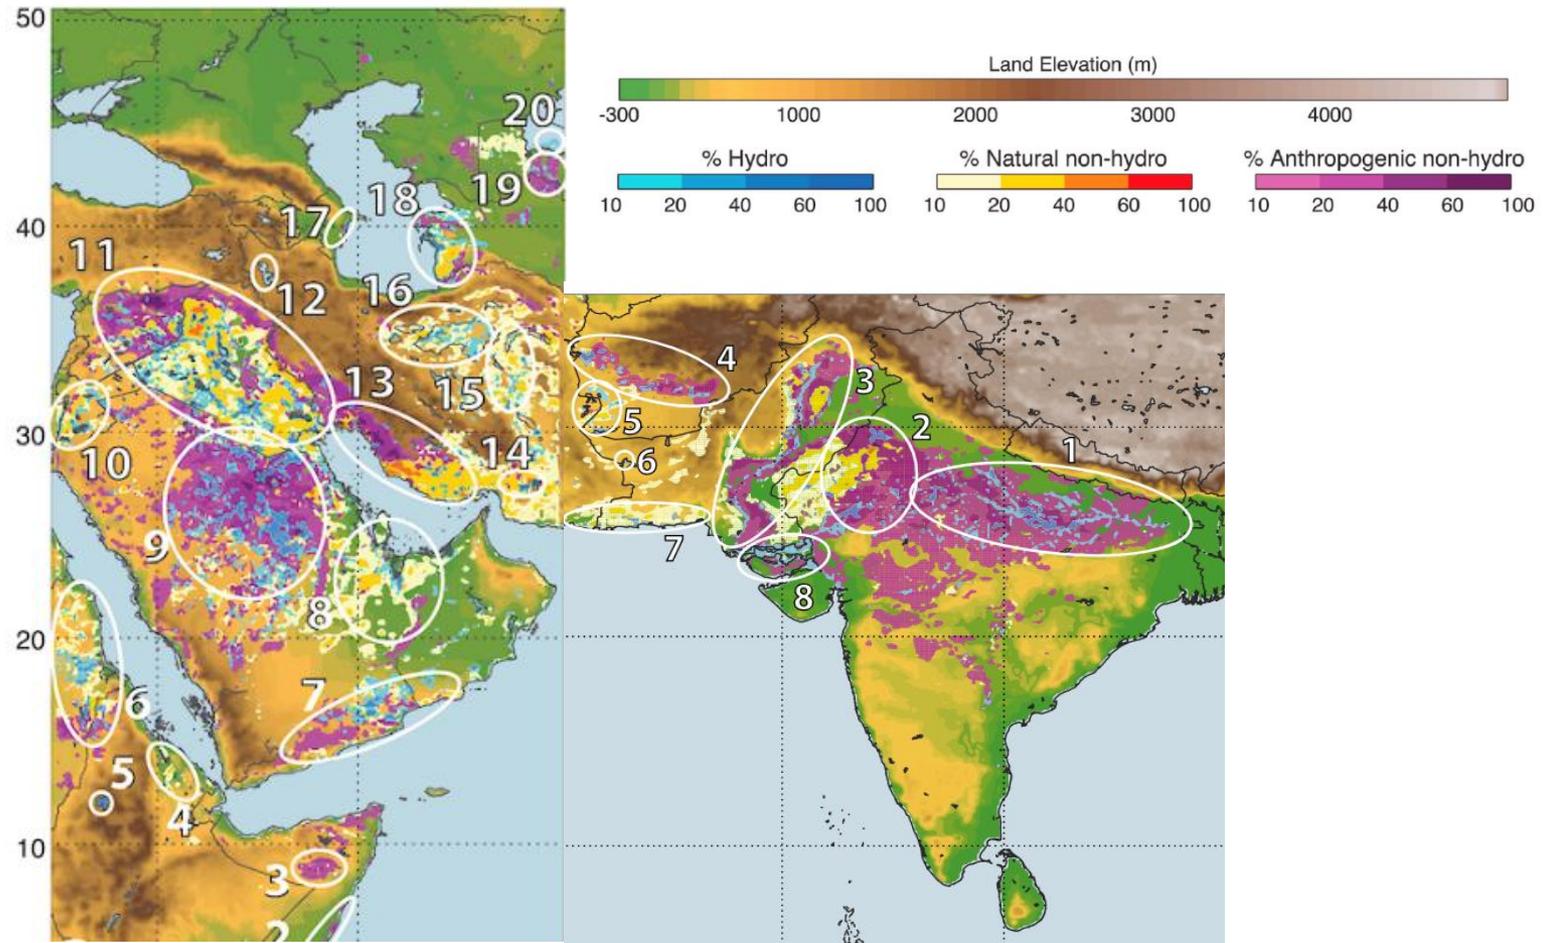

S: probability to have accumulated sediments in the grid cell i of altitude z_i

best fit with the sources identified by Prospero et al. 2000

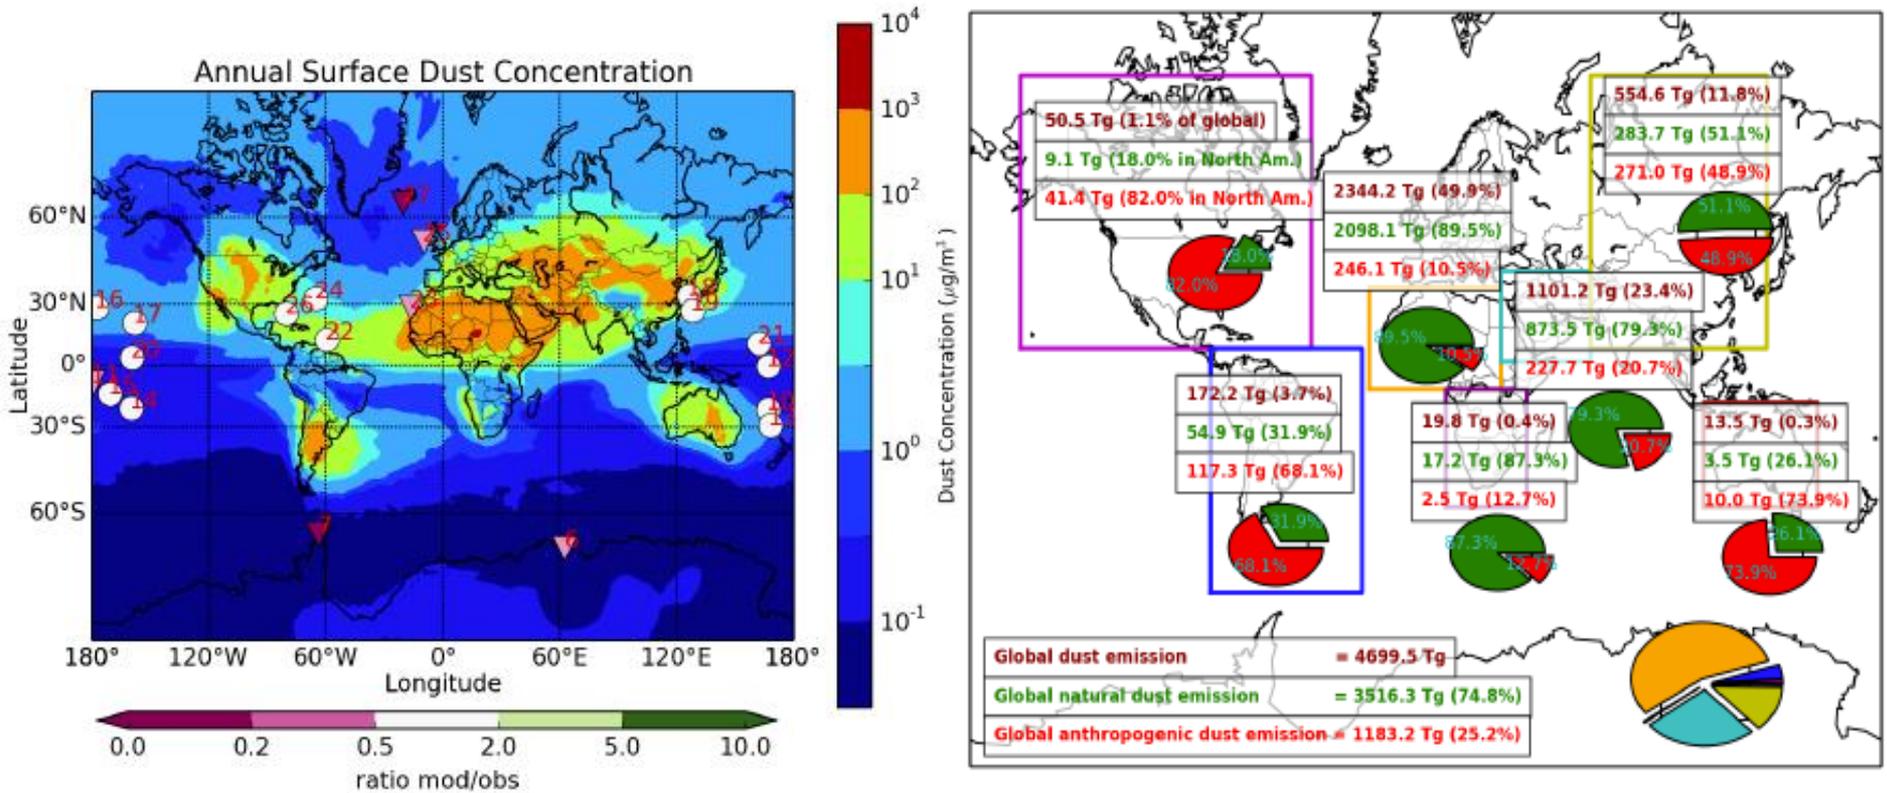

Natural and anthropogenic dust sources

Natural and anthropogenic dust sources

Current quantification natural vs. anthropogenic

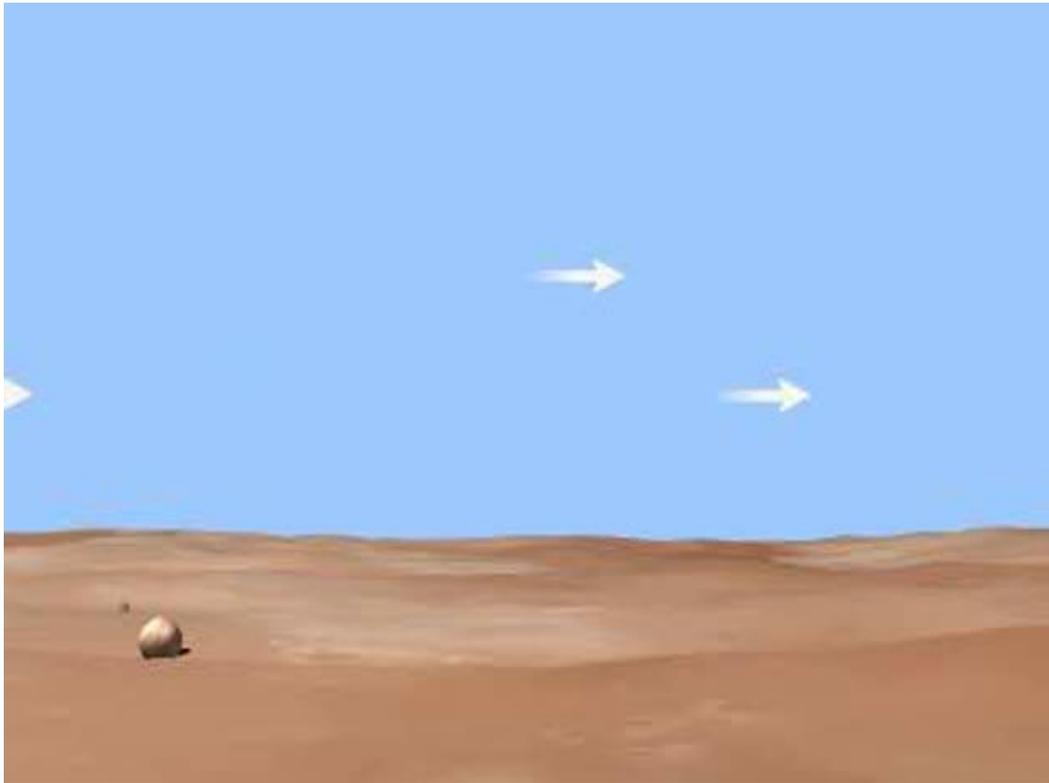

Major challenge for modeling

Dust emission mechanisms

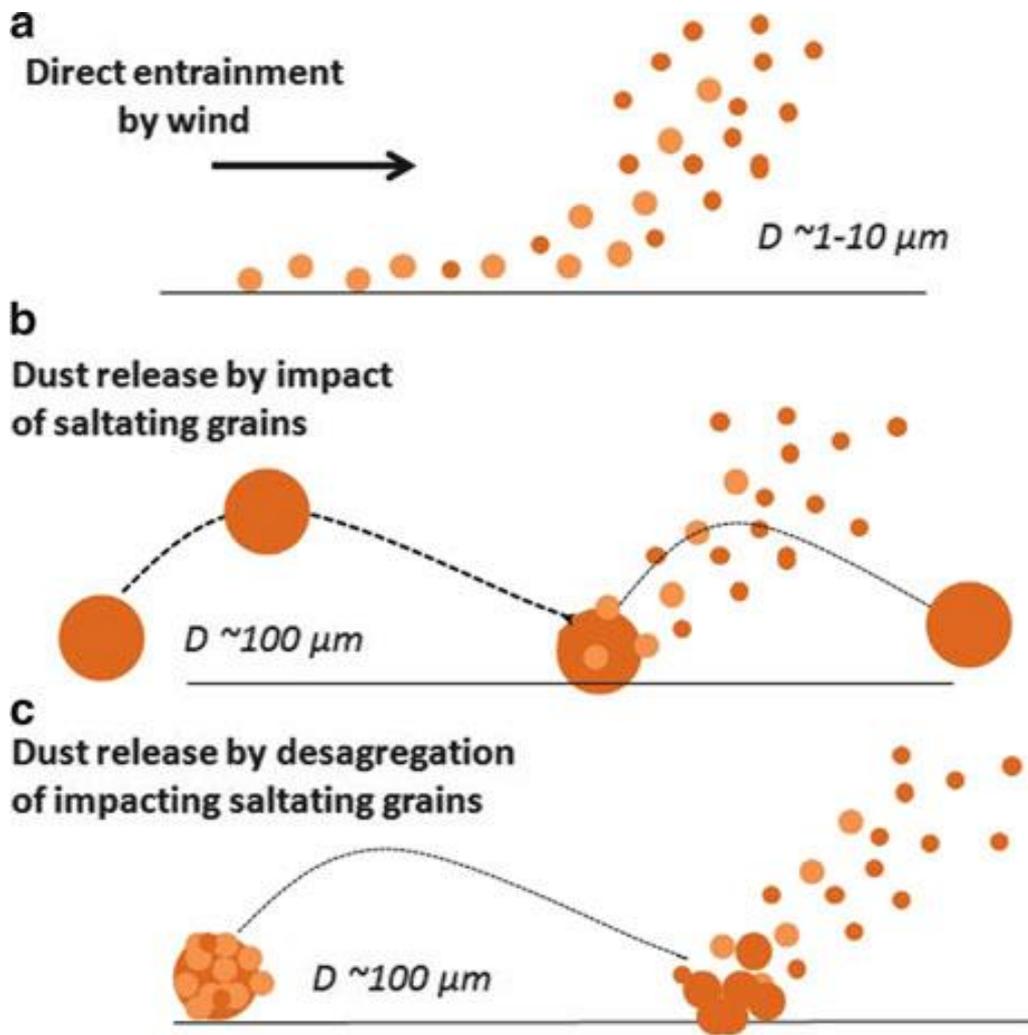

- Complex physical process involving entrainment of soil particles by the surface winds.

- Creep or rolling motion of the largest particles ($> 500 \mu\text{m}$)
- Saltation or horizontal motion of large soil grains (sand) ($50\text{-}500\mu\text{m}$)
- Suspension of dust (after sandblasting or saltation bombardment) ($0.1\text{-}50 \mu\text{m}$)

Movie from the COMET program at <http://meted.ucar.edu/> of the University Corporation for Atmospheric Research (UCAR)

Data Assimilation

Obtaining the 'best' estimate of current atmospheric dust conditions (**analysis**)
Creating datasets describing the recent history of dust in the atmosphere (**reanalysis**)

Dust forecasting models

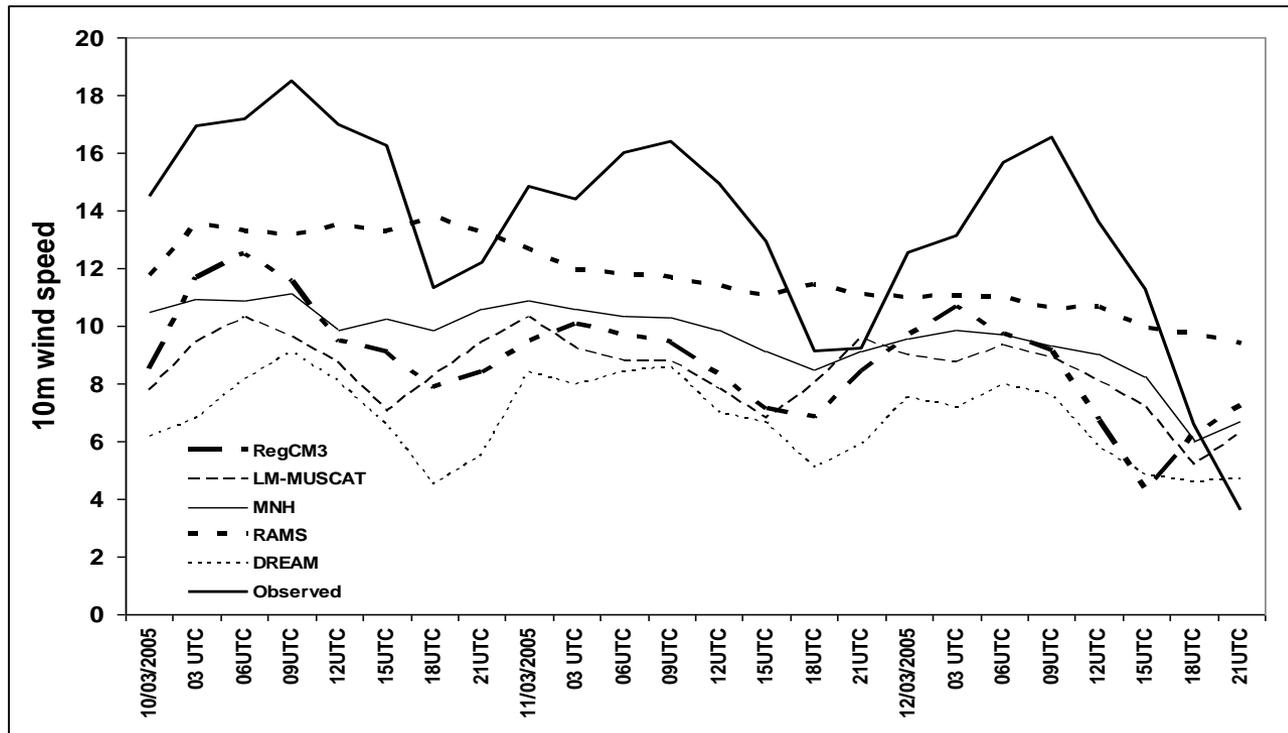

Main differences between dust models

1. *Meteorological driver*
2. *Meteorological input files IBC*
3. *Emission scheme*
4. *Geographic-information database (source mask)*
5. *Land-surface scheme*
6. *Dry deposition scheme*
7. *Wet depositioon scheme*
8. *Spatio-temporal resolution*
9. *Data assimilation*
10.

Mission of BSC Scientific Departments

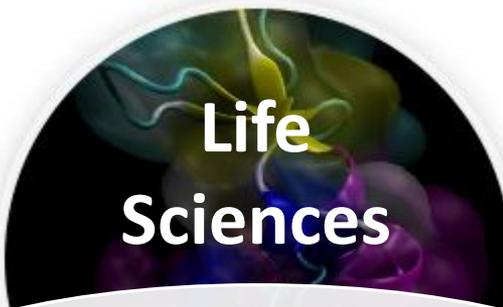

Computer Sciences

To influence the way machines are built, programmed and used: programming models, performance tools, Big Data, computer architecture, energy efficiency

Earth Sciences

To develop and implement global and regional state-of-the-art models for short-term air quality forecast and long-term climate applications

Life Sciences

To understand living organisms by means of theoretical and computational methods (molecular modeling, genomics, proteomics)

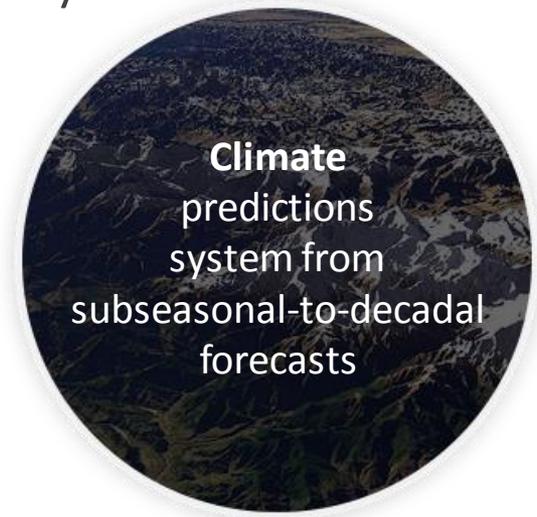

CASE

To develop scientific and engineering software to efficiently exploit super-computing capabilities (biomedical, geophysics, atmospheric, energy, social and economic simulations)

Earth Sciences Department

Environmental modelling and forecasting, with a particular focus on weather, climate and air quality

Environmental modelling and forecasting

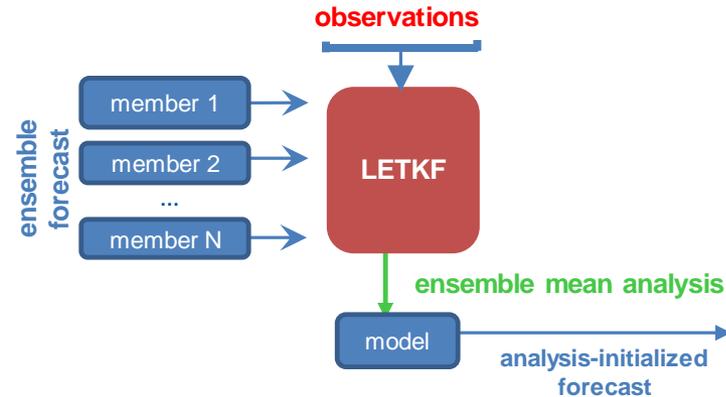

The MONARCH model

- **Multiscale**: global to regional (up to 1km) scales allowed
- Fully **on-line** coupling: weather-chemistry feedback processes allowed
- Enhancement with a **data assimilation** system

MONARCH - Dust Data Assimilation

MONARCH coupled with a Local Ensemble Transform Kalman Filter (**LETKF**) for the assimilation of aerosol optical depth observations

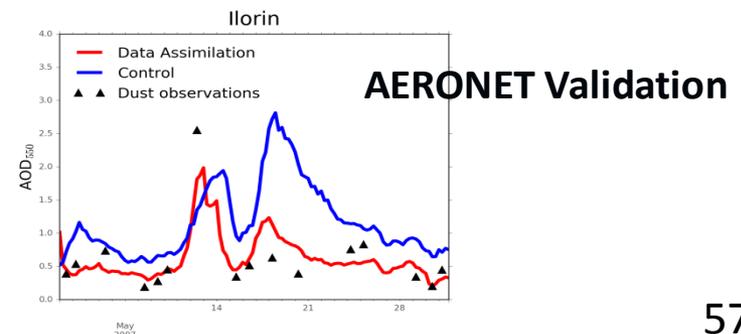

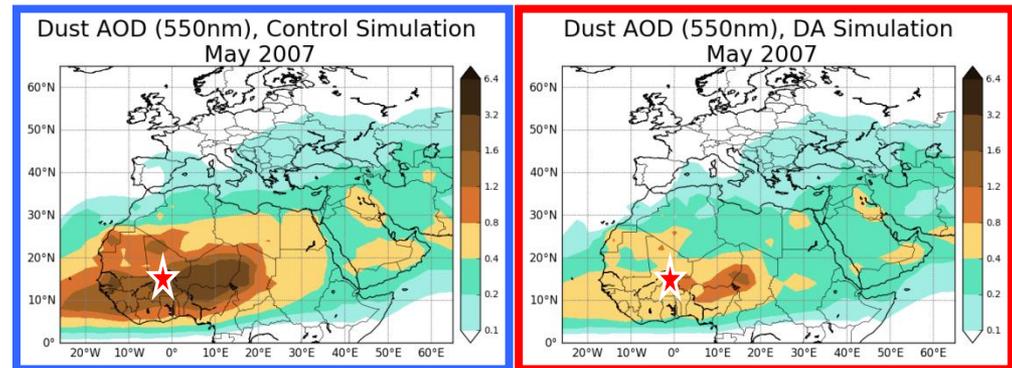

Mineral dust application

The ensemble forecast is based on uncertainties in the dust emission scheme

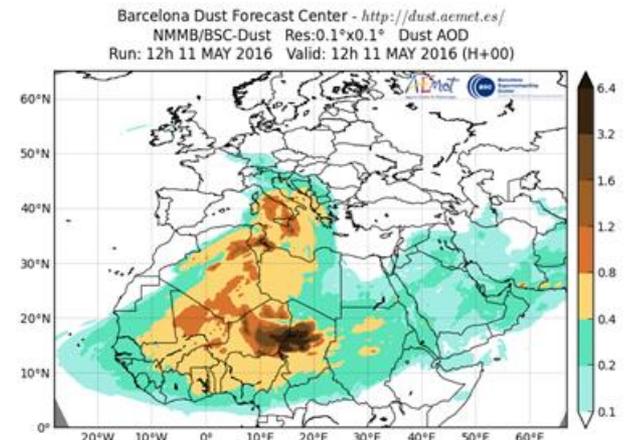

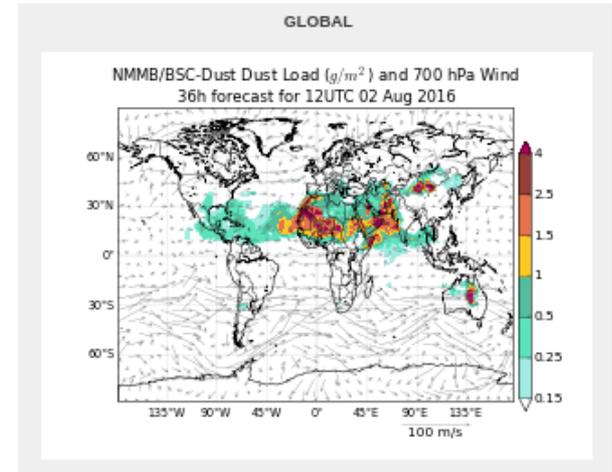

- vertical flux,
- size distribution at emission
- threshold on friction velocity

(Di Tomaso et al., GMD, 2017)
