

Energy forecasts that take climate variability into account: the S2S4E Decision Support Tool

Llorenç Lledó (lledo@bsc.es)

Barcelona Supercomputing Center (BSC), Barcelona, Spain

Energy transition

- ▶ Renewables substitute coal & nuclear
- ▶ Highly variable resource

Atmospheric circulation impacts Energy production & demand

...but the weather is going crazy???

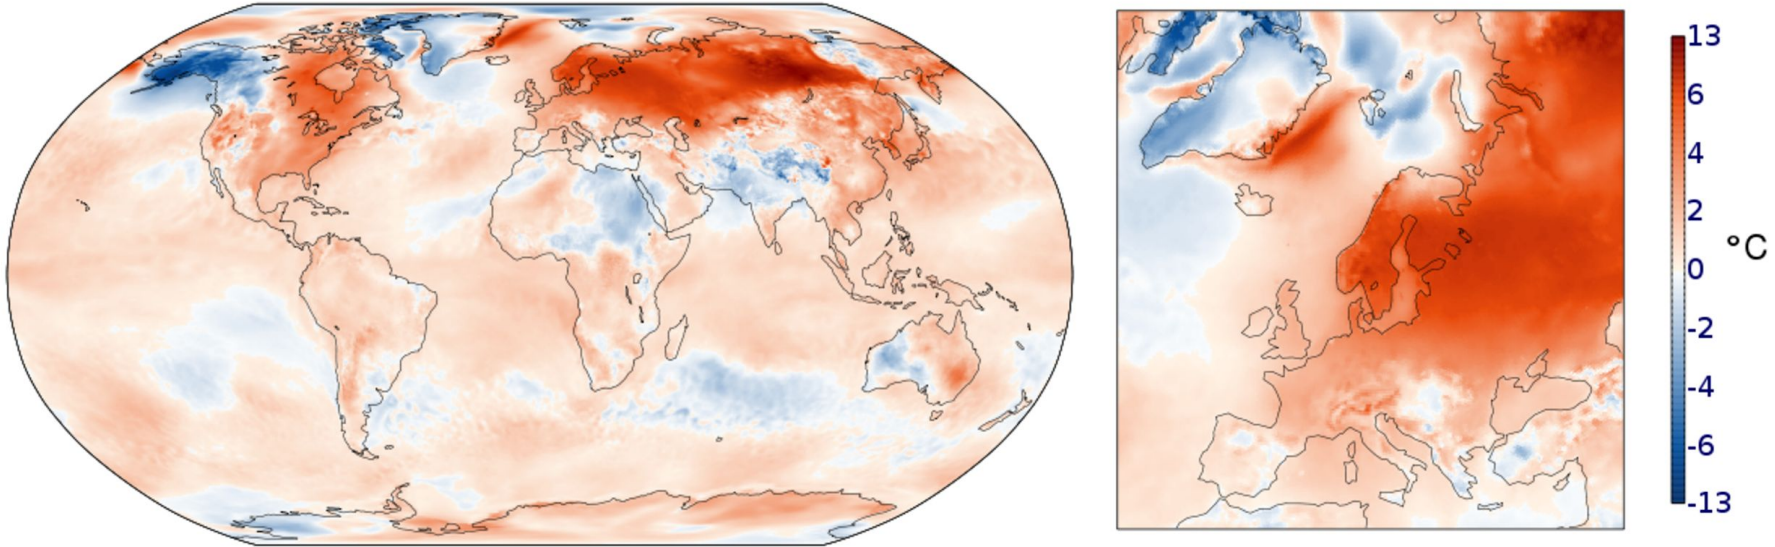

Oslo, December 2019 ---->

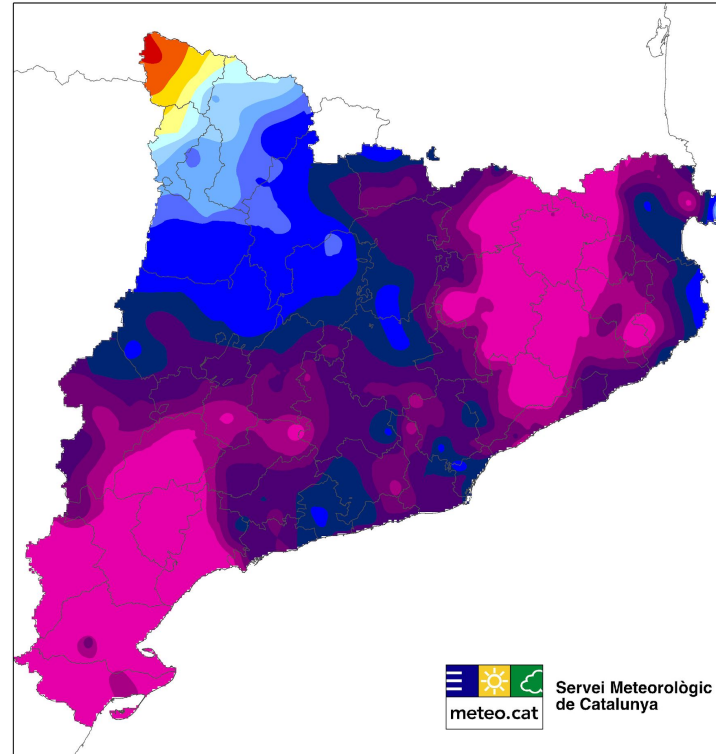

<---- Girona, January 2020
Gloria storm, ~400mm in 4 days

Hottest January ever in Europe

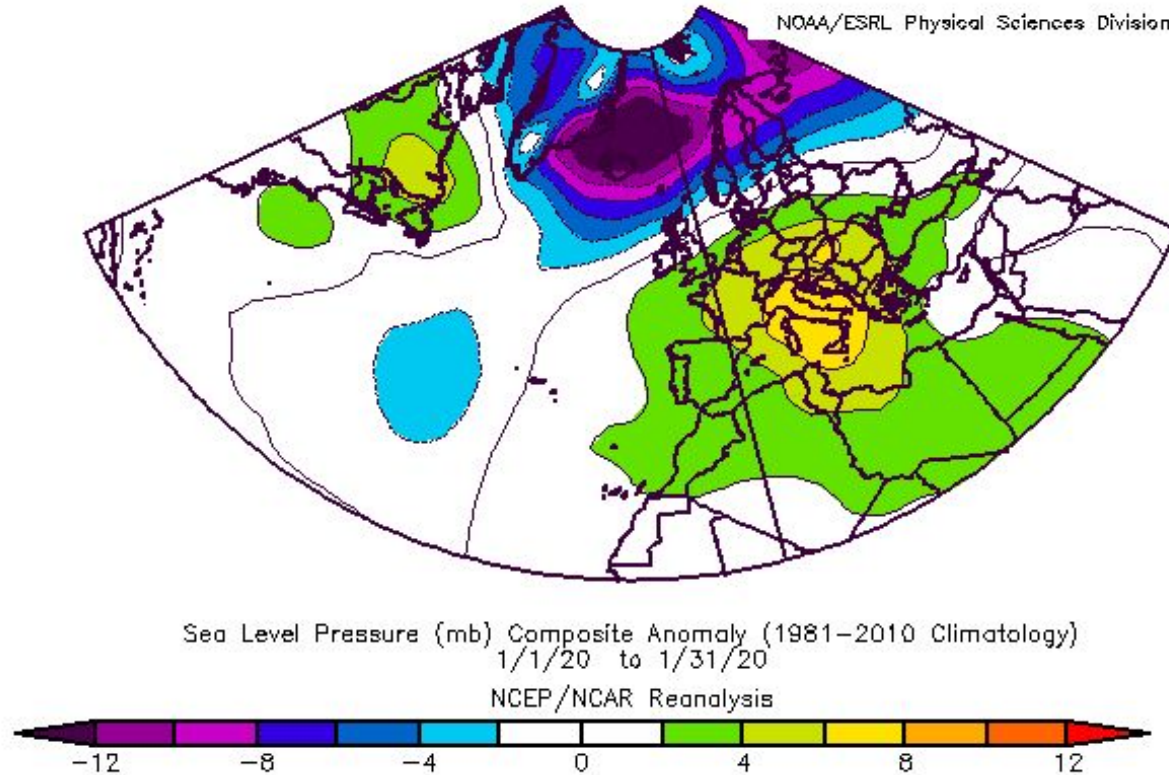

Surface air temperature anomaly for January 2020 relative to 1981-2010

Rainiest January ever in Catalunya

January 2020: strong NAO+ pattern

Climate Stripes for Germany

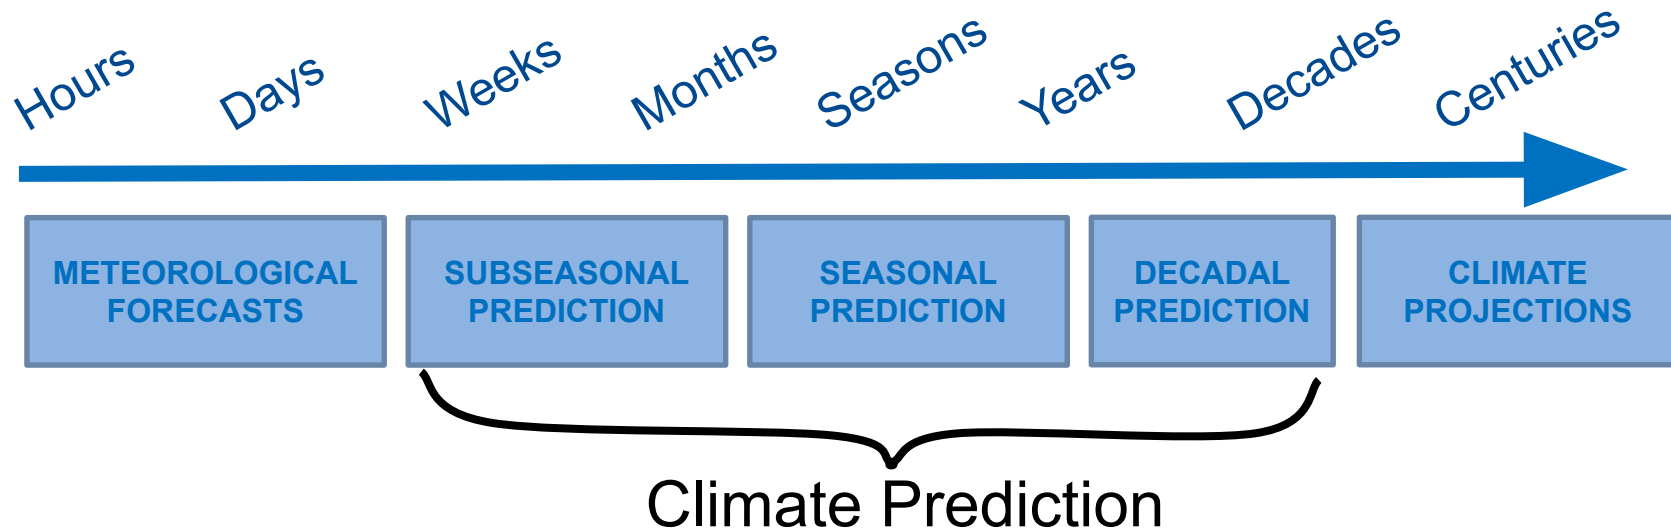

Evident trend ----->
Climate change

Substantial variations from one year to the next one
Interannual variability

Can we anticipate unseasonal weather months ahead?

Earth System predictability

- ▶ How can we predict conditions for the coming season if we cannot predict the weather next week?
Slow components of the Earth System force the atmosphere.

Climate forcings

Arctic Sea ice extent from NSIDC

- ▶ Low arctic sea ice
- ▶ Solar radiation is not reflected
- ▶ Ocean temperature rises
- ▶ Atmospheric circulation changes
- ▶ Energy demand & generation is affected

→ This is happening now,
not in 50 or 100 years!!!

Britain's turbines are producing 40% less energy as wind 'disappears' for six weeks across the UK causing record low electricity production

- Britain got 15 per cent of its power from wind last year — twice as much as coal
- Since the start of June, wind farms have been producing almost no electricity
- The 'wind drought' has seen July 2018 be 40% less productive than July 2017
- In the still weather, solar energy has increased by 10% to help cover the drop-off
