C3S-Magic (C3S 34a Lot2)

The Metrics and Access to Global Indices for Climate Projections (MAGIC) portal provides the functions as requested in the C3S tender "Global Climate Projections: Data Access, product generation and impact of front-line developments" (GCP). It provides solutions that allow to assess GCM projections using well-established metrics, and manipulation tools to allow tailoring the outputs to the users' needs.

Currently it is a demonstration version of the portal, demonstrating the functionality we have prepared up to June 2018.

Data Discovery

Bringing calculation to the data

The platform implements High Performance Computing and Big Data techniques

Uses developed ESMVal Tool recipes

European

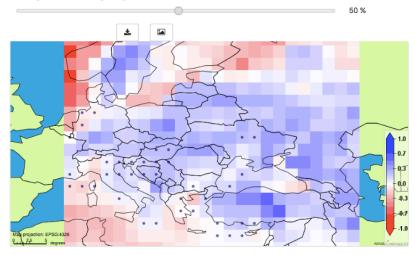

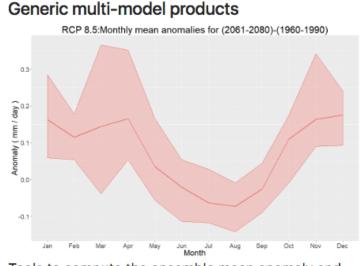

Precipitation quantile bias

Ensemble anomaly plots

Maps with percentage of models agreeing on the sign of (sub-)ensemble-mean anomalies Stippling (% of members agreeing):

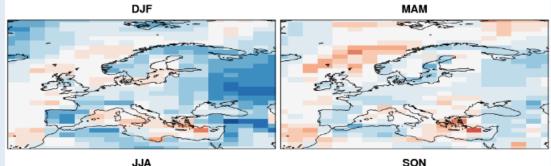

Tools to compute the ensemble mean anomaly and the ensemble variance and agreement and plot the results as maps and time series.

Energy sector: demand and supply

Metric Results

- Demand based on temp. variability
- Extreme spells
- Diurnal temperature indicator
- Supply wind capacity factor

Change in DTR indicator (2020-2040) - (1960-1990)

Selection of models. Selection of exceedance threshold. Selection of minimum duration for an event.

Costal areas: storm surge estimator

Estimates surge height from anomalies in mean sea level pressure and wind

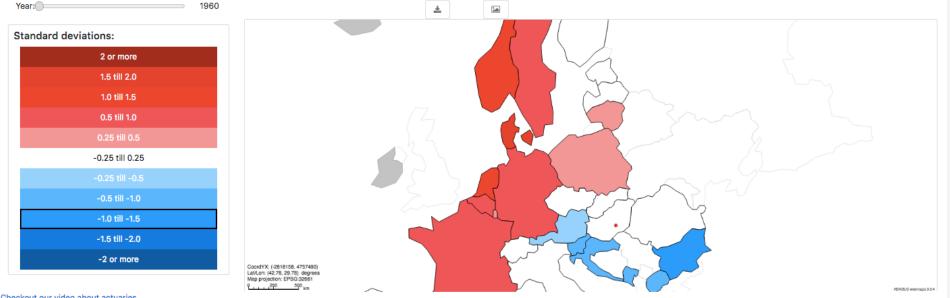

Simple and fast

Intended to quickly browse large data volumes and identify "interesting" cases

Insurance / Actuaries index Water and hydrology						

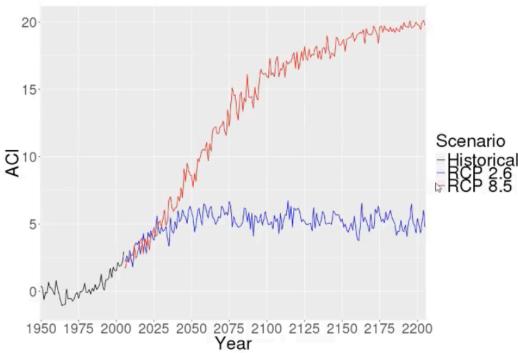

The changing risks between the recent past and the future are of great interest to the insurance industry because even slight changes in climate characteristics can translate into large impacts on risk distribution/management and expected losses. Comprehensive risk indices such as the ACRI, which integrates changes in frequency and magnitude of key climate indicators and elements of hazard, exposure and vulnerability, are crucial for decision making processes.

Checkout our video about actuaries.

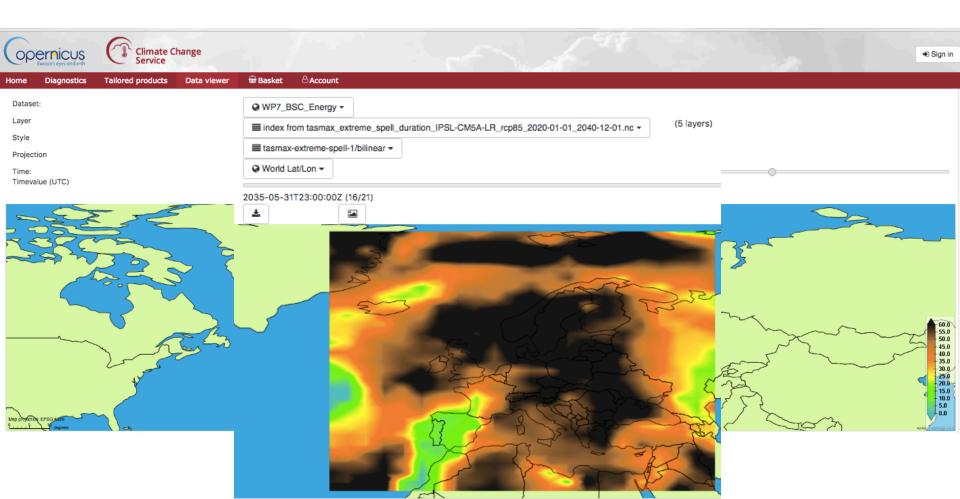

Actuaries Climate Index

Tool to compute extreme indices relevant to the insurance industry. These indices are based on the ETCCDI indices, and there are currently 5 available for extreme heati (tx90p), cold (tx10p), wind (wx), drought(cdd) and flooding (rx5day). The individual indices can be combined into a single index with or without weightings for each component. This combined index is roughly analagous to the Actuaries Climate Risk Index.

Description of user-changeable settings on webpage':' Selection of period for defining the baseline thresholds (1960-1990 by default). Selection of indice. Selection of period for projections. Selection of RCP scenario. Selection of longitudes and latitudes. Selection of models.

Collaboration with users

- Private sector
- Water and DRR Consultancy
- Insurance sector
- Energy sector
- Scientists
- Water utility

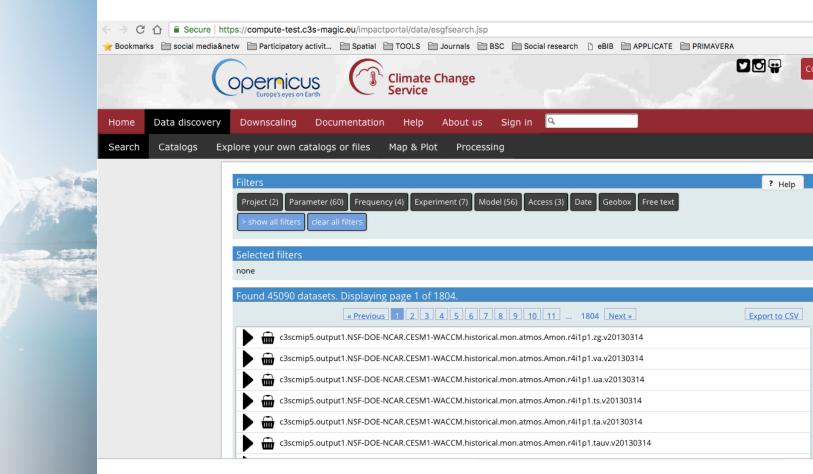

Everyone welcome to evaluate the platform!

Collaboration with other C3S

Thank you for your attention!
